TO REVERSE MENOPAUSAL CHANGES

"I cannot refrain from mentioning the treatment of the MENOPAUSAL SYNDROME with œstrin Quite small quantities of œstrin by mouth (1,000 to 5,000 units) are usually sufficient to control the hot flushes, headaches and dizziness and to induce a remarkable feeling of well-being, and rather larger doses have a miraculous effect on such sequelæ as pruritus vulvæ, atrophic senile vaginitis, vaginal ulceration and kraurosis "

'Elastoplast' Elastic Strapping Plaster

This illustration depicts the exceptional elasticity which is characteristic of all 'Elastoplast' products The plaster stretches readily to nearly twice its original length

'Elastoplast' Elastic Adhesive Plaster is preferred on account of its extreme adaptability and ease in handling

The 3-yard lengths (stretching to 5/6 yards) can be had on metal spools in tins, or on the convenient SNAP SPOOLS, widths ½", 1" and 1½" 1-yard lengths (stretching to 1¾/2 yards) are available on card cores in tins Free samples on request to Dept B 17, T J Smith & Nephew Ltd, Neptune Street, Hull

Just Ready—New (4th) Edition

CECIL'S MEDICINE

By 140 Authorities

Here is a work written by an imposing group of authors, most of whom are teachers—and unified into one great organized discussion by its Editor Dr Russell L Cecil of Cornell

On etiology on symptomatology, on diagnosis and on treatment this book is practical specific and thorough Particular attention is given to those details that will enable the reader to obtain a secure and working knowledge of the many diseases discussed Symptoms are not merely described, but are interpreted in their relation to diagnosis You are told what to look for in the examination and how to find it But more than that, you are guided in the methods of treatment that should be instituted, then told and shown just *how* these methods should be used to effect the proper results

Cecil has been described as a work of *applied medicine* and that is exactly what it is—a comprehensive and unusually clear description of the facts and helps that are essential in both the practice and study of modern medicine

Remade and drastically revised throughout the New (*4th*) Edition—*just ready* will prove a worthy successor to past editions of this work because it includes the new things in medicine—the latest knowledge of disease the most recent developments in their recognition and to-day's tried and tested therapeutic agents and methods

SOME of the NEW and REVISED MATERIAL

The BRITISH MEDICAL JOURNAL said of the Third Edition

It is a standard reference and text book clearly written, up to date, well arranged and well illustrated. Special attention is given to the latest methods of treatment. The whole text is current, clear and readable. It is well printed and well bound. It is well furnished, and has an excellent index

Belts by Roussel bring *health* as well as *beauty*

Women will always seek to improve their figures according to the fashionable line of the moment. How fortunate then when they can do so with a belt that is beneficial to health!

The patent Roussel elastic weave that allows variations in tension over different parts of a belt enables J. Roussel to model a belt for every individual case. Surgeons and doctors can agree to their patients wearing a belt by J. Roussel knowing that with the "varied tensions" feature it can be made to exact measure and to extend pressure or support only where it is needed.

If you would like to know more about the Roussel Belt may we send you a copy of our beautifully illustrated Catalogue?

Most reliable for oral administration of Nuclein and the entire Vitamin B Complex

ALUZYME

NON-AUTOLYSED YEAST

Aluzyme is plain Brewers Yeast stabilised without destruction of cell vitality. Hence its therapeutic superiority as it provides all the B Vitamins the Nuclein and organic mineral compounds of Yeast, in the fully active state of living substance.

COMPARE THESE VALUES.

Vit B1 1110 International Units per ounce
Vit B2 Complex Maximum for dried Yeast *(Officially certified.)*
Nuclein Content Four milligrammes per grm
Glutathione Reaction: Brilliant magenta
Microscopical 95% living cells No foreign matter

Specific in all forms of B avitaminosis. Valuable in toxæmias and many digestive troubles, and as a general adjuvant in affections of the skin. Given with good results with calcium sulphide in furunculosis and with iron in anæmia.

Supplied for dispensing in bottles of 1,000 and 500 Tablets. Northern Ireland: McMullan & Co. Ltd. Victoria Street Belfast. I.F.S.: Mac Roberts (Ireland) Ltd. Grand Canal Quay Dublin. Professional samples and literature substantiating the claims above on request.

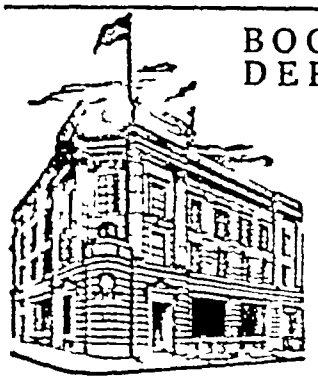
DEMONSTRATIONS OF
PHYSICAL SIGNS IN CLINICAL SURGERY
By HAMILTON BAILEY, F.R.C.S.(Eng.)

It is almost unnecessary to say anything in recommendation of this well-known work, though it is a pleasure to record once again that it fully maintains the very high standard of its predecessors.—*The Journal of Surgery*

2nd Edition. Fully Revised. 158 pages. 50 Illustrations. 7s. 6d. net; postage 6d.

LATENT SYPHILIS AND THE AUTONOMIC NERVOUS SYSTEM
By GRIFFITH EVANS, M.A., D.M.(Oxon.), F.R.C.S., D.O.M.S.

This volume is unquestionably a very important contribution to syphilology. The reviewer is convinced that if the second edition is carefully studied by all who are engaged in medical work a great deal of uninspected syphilis will be uncovered and with that much human suffering will be alleviated.—*Medical Officer*



436 pp. 8 *Illustrations. 17 in Colour. 25s. net; postage 6d.*

SYMPTOMS AND SIGNS IN CLINICAL MEDICINE
AN INTRODUCTION TO MEDICAL DIAGNOSIS
By F. NOBLE CHAMBERLAIN, M.D., M.Sc., M.R.C.P.
With a Chapter on the Examination of Sick Children
By NORMAN B. CAPON, M.D., F.R.C.P.

The information given . . . is throughout up to date and clearly set forth.—*B.M.J.*

CARBON-DIOXIDE RESUSCITATION

THE Sparklet Resuscitator has again and again proved invaluable in the Carbon Dioxide treatment of Respiratory Failure Emergencies

The "C" Size (Price 17/6) is ideal for patients' use in the treatment of

HAY FEVER.

Write for Special Booklet on the uses of Carbon Dioxide in General Practice

CARBON DIOXIDE IN GENERAL PRACTICE.

To the Editor of THE LANCET

SIR,—During one single hour of general practice last week the value of carbon dioxide resuscitation was very strongly brought home to me by three events (1) a mother with respiratory failure under chloroform during an instrumental labour (2) the child which I quickly artificially respiration before it breathed (3) as soon as I had returned to my house a road accident in which a youth received severe multiple injuries through contact with a motor vehicle. When I arrived on the scene he was unconscious almost pulseless and his breathing nearly imperceptible. I applied a diluted carbon-dioxide air mixture under a facepiece for a few moments while I examined him. His breathing and pulse improved and he was fully conscious when he was loaded into the ambulance although his injuries included frozen ribs a fractured shoulder and a leg which was crushed from the thigh to the ankle.

I feel confident that many of our road fatalities are due to respiratory failure within the first few moments after the accident which carbon dioxide made available by a portable supply might do much to prevent

I am, Sir, yours faithfully,

Feb 17th M B, Cantab Lond

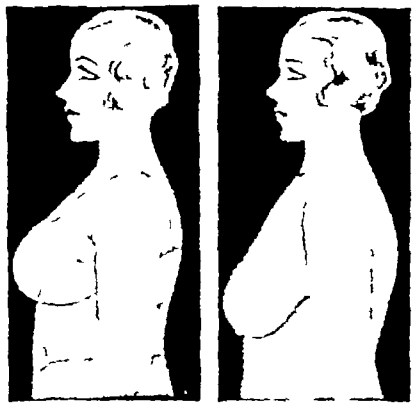
Spencer Individually Designed Bandeaux

PROVIDE UPLIFT WITHOUT CONSTRICTION



Spencer Bandeaux designed individually for each wearer, provide specific and **continuous** uplift for even the heaviest breasts

The **bust pockets** are made of a slightly stretchy soft material that permits of free breathing without constriction

The **below bust section** of a Spencer Individually Designed Bandeau is fashioned of non-stretchy fabric, designed shaped and made to fit snugly preventing the breasts from sliding out of the bust pockets

The **back section** is designed to stay firmly anchored to the figure, so that the weight of the breast cannot pull the back of the bandeau upward on the figure and lessen the degree of uplift that is desired

An exact sketch of the uplift and [illegible] of a Spencer individually designed bandeau

Doctors prescribe Spencer Bandeaux for the following reasons

1. To prevent sagging of the muscles and skin—and subsequent ptosis
2. During pregnancy and for nursing mothers to provide support and uplift without pressure on the nipples
3. As a preventive of breast abscesses and caking

Spencer Bandeaux are prescribed by thousands of doctors for their wives and nurses as a general health measure

Trained Spencer Corsetières are resident throughout the Kingdom. Name of nearest gladly supplied on request. [illegible] trained Spencer Corsetières [illegible]

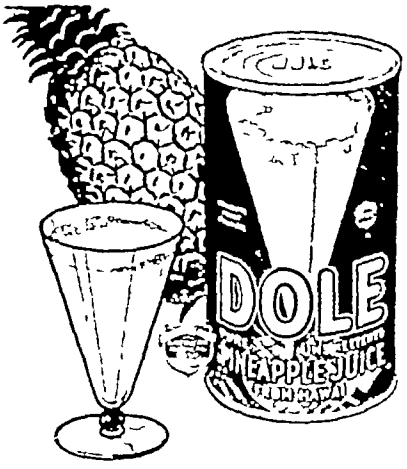
Oral Vaccine for the prevention of Colds and Influenza

Since Genora brand Oral Vaccine was introduced to the Medical Profession last Winter extensive clinical and laboratory tests have shown that it establishes a high degree of immunity against colds and influenza, the oral vaccine has also proved successful in the treatment of chronic bronchitis and similar respiratory infections

This vaccine contains hæmolytic streptococci in addition to other organisms incriminated in the causation of coryza and influenzal infections It has been found that the ingestion of the oral vaccine against colds and influenza also develops immunity to diseases caused by hæmolytic streptococci



Particulars concerning Genora brand Oral Vaccine will be found in the new brochure on Vaccine Therapy which has recently been published by Genatosan Ltd This booklet also gives information regarding a wide range of vaccines administered by hypodermic injection and the standard types of Local Immunity Products A copy of the brochure will gladly be supplied to any physician on request

This pure, unsweetened Dole Pineapple Juice packed in vacuum-sealed tins is

HIGH IN NUTRITIONAL CONTENT

YOU can always count on unvarying quality and goodness in Dole Hawaiian Pineapple Juice. And the exclusive Dole Fast Seal Vacuum Packing Process preserves to a high degree the *desirable fresh fruit constituents*. As a result whenever your patients open a tin of Dole Hawaiian Pineapple Juice they are greeted by a tropical aroma by a tangy flavour of juice that is unvaryingly delicious.

The original Hawaiian pineapple juice Dole juice has received the Seal of Acceptance of the American Medical Association's Committee on Food. It not only contains important fresh fruit elements but is a natural source of vitamin A B and C.

J. K. Husband & Co. Ltd. 10 Eastcheap London E.C.3

PREPARING FOR A LUAU NATIVE FEAST—There are lots of preparations to be made before the luau is ready to be served. The poi must be pounded the pig cooked in the imu—under ground oven—pineapples, banana and other fruit are gathered, squid and fish must be caught on the reef, and the ti leaves gathered from the mountain side in which to wrap the food and also to serve as covering for the table. To the happy Hawaiian there is almost as much pleasure in all these preparations as in partaking of the delicious feast.

Here is a typical analysis of Dole Pineapple Juice:

Moisture	85·3
Ash	0·4
Fat (ether extract)	0·3
Protein (N x 6·25)	0·3
Crude fibre	0·02
Titratable acidity as citric acid	0·9
Reducing sugars as invert sugar	12·4
Carbohydrates other than sugars (by difference)	0·38

P.S. If you will drop us a line on your letter head we will be glad to send you a free sample tin of Dole Hawaiian Pineapple Juice the perfected pineapple juice.

Ergoapiol (Smith)

A Menstrual Regulator . . .

When the periods are irregular due to constitutional causes Ergoapiol (Smith) is a rational combination of Ergot Apiol (MHS) and Pituitary Extract. It will be found that the regularity of the periods, the quality of the flow and the duration of the menstrual period are greatly improved by the administration of Ergoapiol (Smith).

In cases of Amenorrhœa Dysmenorrhœa Menorrhagia and Metrorrhagia Ergoapiol (Smith) is a good uterine tonic and hæmostatic. Valuable in other cases after delivery of the child and for the menstrual irregularities of the Menopause.

Prescribe 1 or 2 capsules or times daily. Supplied in packets of capsules. Literature on request.

SULPHONAMIDE-P B.D.H.

(*p*-Aminobenzenesulphonamide)

Clinical evidence continues to confirm that Sulphonamide-P B D H, even when administered orally, possesses remarkable bacteriostatic and bactericidal activity against hæmolytic streptococci

There is also substantial evidence of the value of Sulphonamide-P B D H in infections due to bacteria other than hæmolytic streptococci—meningococci, staphylococci, gonococci, etc

Sulphonamide-P B D H is being prescribed, therefore, as a regular routine for the prevention and treatment of puerperal septicæmia, gonococcal infections, pyelitis, B coli infection, acute juvenile rheumatism, meningitis, septic parotitis, erysipelas, tonsillitis, scarlet and typhoid fever

Sulphonamide-P B D H is for oral administration in tablets each containing 0·5 gramme of the pure substance, *p*-aminobenzenesulphonamide.

"ALOCOL"

Colloidal Hydroxide of Aluminium

Rational Antacid Therapy

APART from those cases due to actual organic disease, the treatment of the syndrome of symptoms known as indigestion, generally resolves itself into an attempt to overcome hypersecretion of acid and to soothe the irritated or inflamed gastric mucosa.

That Alocol possesses intrinsic qualities which render it particularly valuable as a gastric sedative and antacid is now well established. Its freedom from the constipating effect of bismuth, the laxative action of magnesium salts and the gas forming properties of sodium bicarbonate are especially noteworthy.

Alocol forms with the gastric contents a colloidal jelly which has the power of adsorbing free hydrochloric acid. Its markedly soothing effect on the gastric mucosa promptly relieves pain and discomfort. It does not interfere with the normal process of digestion and is free from the danger of alkalosis.

Complete chemical history of Alocol with convincing clinical reports and supply for trial sent free to physicians on request

ALASIL

Safe Salicylate Therapy

THE popularity of acetyl salicylic acid is undoubtedly due to the fact that it is one of the safest and most effective non narcotic analgesics available. Too often, however, its use has been discarded by the physician on account of its tendency to irritate the stomach and because entirely pure preparations are not always available.

"Alasil" provides the beneficial therapeutic effects of pure acetyl salicylic acid in such a form that it is acceptable even by disordered digestions. This tolerability is due to the fact that it combines calcium acetyl salicylate—the least irritating salicylate compound—with 'Alocol' a potent gastric sedative and antacid.

Since "Alasil" is better tolerated than acetyl salicylic acid its use can be pushed or prolonged to a much greater extent than the latter. "Alasil" is therefore an analgesic, antipyretic and antirheumatic which can be employed with complete confidence in all the many conditions in which such an agent is indicated.

A supply for clinical trial with full descriptive literature sent free on request

BRITISH COD LIVER OIL PRODUCERS (HULL) LIMITED ST ANDREWS DOCK HULL, ENGLAND

AN ANNOUNCEMENT

The British Drug Houses Ltd have pleasure in announcing the issue of MANDECAL (Compound Calcium Mandelate B D H) for use in the treatment of urinary infections

The introduction of MANDECAL is the outcome of an investigation (*Lancet*, May 8th, 1937, p 1104) undertaken with a view to finding a means of overcoming certain disadvantages which are associated with mandelic acid treatment, for instance, occasional nausea and dyspeptic discomfort In this investigation 'the same good results' were obtained as with other preparations of mandelic acid, but without any of the drawbacks associated with the latter treatment

MANDECAL has been subjected to clinical trial and has been found to be fully as effective as ammonium mandelate, to cause no gastric disturbances and to be more readily acceptable to the fastidious patient

MANDECAL is a light, pleasantly-flavoured powder containing 75 per cent of pure calcium mandelate, it possesses an outstanding advantage accruing from its ready miscibility with water It is necessary merely to measure the required dose and to stir it into about two fluid ounces of water in a glass, immediately an even suspension is formed ready for administration

MANDECAL is available in bottles containing approximately 130 grammes sufficient for treatment lasting seven days

MANDECAL

(Compound Calcium Mandelate B D H)

Literature on request

THE BRITISH DRUG HOUSES LTD. LONDON N.1

SERENOL

biological non-toxic

SEDATIVE

Formula

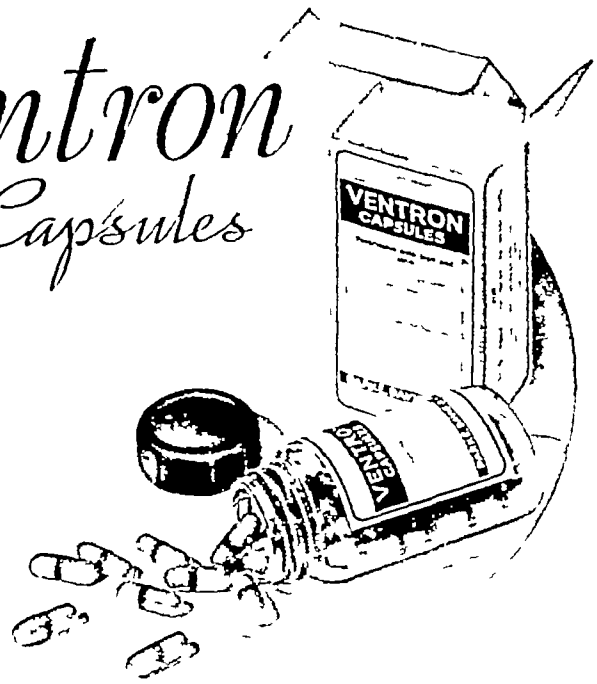
Campho Sulphonate of sparteine	6·0 grams
Campho Sulphonate of ephedrine	2·5 „
Extract of boldo	10·0 „
Extract of crataegus	20·0 „
Extract of salvia	10·0 „
Tincture of marrubium	10·0 „
Glycerine extract of thyroid (1 equals 1 of fresh gland)	0·10 „
Valerian	50·0 „
Hexamethylene tetramine	10·0 „
Excipient q.s.	ad 1,000 c.c.

Serenol is a sedative with action on the centres of the nervous vegetative system, sympathetic and parasympathetic, and on the cortical centres. Recent knowledge has shown the interaction of nervous vegetative system and endocrine system and on this knowledge SERENOL is based. It is thus a biological not a symptomatic, sedative, and, unlike many other sedatives, has not a direct depressant action on the cortical cerebral centres.

Serenol possesses this action on the basis of its formula.

Serenol is indicated in conditions of anxiety and general irritability, insomnia, hyperthyroidism, hyperadrenalism (as in neurocirculatory asthenia, effort syndrome), the so-called nervous palpitations of the heart, etc.

Serenol is given in the following dosage. For mild cases one to two dessert spoonsful on retiring. For more severe cases one dessertspoonful at 10 a.m., one dessert spoonful at 4 p.m. and two dessertspoonsful on retiring.



Serenol, being a biological sedative containing no barbiturate, is not habit forming.

PRICE 4/6 per 4 oz. bottle

Sample and Literature on request.

ANTOSTAB is a gonadotropic hormone prepared from pregnant mares' serum, having a powerful action in stimulating ovulation and the secretion of the œstrogenic hormone by the ovary

ANTOSTAB is indicated in the treatment of conditions associated with anterior pituitary and ovarian dysfunction Excellent results have been obtained in the treatment of Primary and Secondary Amenorrhœa and Metrorrhagia

ANTOSTAB is supplied in boxes containing ampoules of 100 mouse units, and ampoules containing 1 c c of 0 90% Sodium Chloride Solution as a solvent for Antostab Single ampoules and boxes of six ampoules

ERGOMETRINE

The rapidly-acting ergot alkaloid

For routine administration after parturition
Has been described as the substance responsible for the traditional clinical effect of ergot

TABLOID ERGOMETRINE 0·5 mgm
WELLCOME SOLUTION OF ERGOMETRINE
0·5 mgm in 2·5 c.c.

Dose—0·5 mgm to 1 mgm By mouth

TABLOID HYPODERMIC ERGOMETRINE
0·5 mgm *for Intramuscular Injection*
0·125 mgm *for Intravenous Injection*

HYPOLOID ERGOMETRINE
0·5 mgm in 1 c.c. *for Intramuscular Injection*
0·125 mgm in 1 c.c. *for Intravenous Injection*

'WELLCOME' ERGOTOXINE ETHANESULPHONATE

For prolonged effect during the puerperium Originated and introduced by Burroughs Wellcome & Co

CONSERVATIVE TREATMENT OF CANCER OF THE BREAST*

BY

GEOFFREY KEYNES, M A , M D Camb , F R C S

Assistant Surgeon St Bartholomew s Hospital Surgeon Mount Vernon Hospital Northwood

(WITH SPECIAL PLATE)

It is now nearly fifty years since William Stewart Halsted of Baltimore introduced the radical operation for the treatment of cancer of the breast The technique of the operation has undergone modification during that period but Halsted s principle has been accepted throughout the world of surgery and for many years the radical operation has been more or less standardized Moreover the degree of standardization has been some indication of the satisfaction with which surgeons have regarded the results that have been achieved The satisfaction has been only relative because treatment of cancer in all parts of the body has been disappointing The treatment of cancer in the breast has perhaps been less disappointing than in most other positions

Standardization must not however be allowed to create a fixed belief that no further improvement is possible and that any suggested change is necessarily to be regarded with disapproval Most surgeons who have taken the trouble to follow up their patients after performing the radical operation for cancer of the breast are indeed gravely dissatisfied with their results I have described elsewhere (Keynes 1929 1932) the earlier stages of an attempt to find out whether irradiation with interstitial radium needles might be used to mitigate or possibly abolish the necessity for so drastic a form of treatment as the radical operation The present communication embodies the late results obtained in a longer series of patients treated with interstitial radium than has hitherto been recorded Encouragement is to be obtained from a survey of the present treatment of cancer in general for irradiation has virtually supplanted surgical operation in cancer of the tongue mouth and fauces and in cancer of the cervix uteri At one time there was a widespread belief that cancer of the breast is not a radiosensitive neoplasm and it was stated particularly in some clinics on the continent of Europe that satisfactory irradiation of the contents of the axilla is impossible These statements I believe to be untrue and a test is provided by the late results of patients treated by the interstitial method

belief that the patients would do just as well if only a local removal of the breast were performed I must confess that my opinion has now gone to the opposite extreme and I am prepared to maintain that if the axillary lymph nodes are extensively infected dissection of the axilla may be harmful and that if they do not appear to be infected it is unnecessary *provided that radical irradiation is carried out in every patient* I have also to confess that I have had increasing difficulty in accepting any theory of lymphatic permeation by cancer cells since so many of its implications seem to be contrary to experience and to common sense I have been greatly interested therefore in anatomical investigations on lymphatics carried out recently at St Bartholomew s and University College Hospitals by J H Gray (1936 1936a) under the inspiration of Professor H H Woollard By the use of thorotrast and barium lymphatics have been made visible and their course traced more accurately than before and it has been shown that there are no lymphatic plexuses in the deep fascial layers Thus the lymphatic system of the breast lies in the gland and on its surface the main lymphatic trunks passing round the fold of the axilla to the axillary nodes No evidence whatever has been discovered in support of the theory of centrifugal permeation On the other hand normal lymphatic channels are found to connect a carcinoma with infected nodes the only possible inference being that carcinoma cells pass to the nodes as emboli usually without forming intermediate points of growth The supposed permeated channels have been shown to be generally infiltration in planes of tissue cleavage or sometimes to be growth in a venule It follows therefore that widespread operations based upon the permeation theory of lymphatics in fascial planes have no real justification If Gray s observations are correct it will be necessary to revise our conception of the spread of cancer and then perhaps the idea of conservative treatment of cancer of the breast may become less repugnant to us

advanced or inoperable tumours were treated in this way, and the results in fifty of these were examined before it was thought justifiable to extend the procedure to the earlier stages of the disease. It was soon apparent that the belief that cancer cells in the breast were not sensitive to irradiation must be abandoned. Some remarkable results were obtained and although the majority of these patients are now dead from metastases many of them remained alive for periods up to eight years without external signs of disease. Six of them are still alive nearly ten years after treatment and five of the six—that is 10 per cent of the whole—are without any signs of disease.

Two of these patients are shown in the illustrations on the Special Plate.

A patient aged 40 (Fig. 1) came with a large tumour in her left breast which had already produced elevation of the breast and retraction of the nipple. The disease was advanced though still operable. There were palpable lymph nodes in the axilla. She was treated with radium alone after the diagnosis had been proved by biopsy. The picture illustrates her present condition. There is some contraction of the breast which followed the disappearance of the tumour but the patient is without signs of disease ten and a half years after treatment.

A stout patient, aged 57 (Fig. 2) had a very large tumour in the left breast. It was infiltrating the skin and was adherent to the chest wall so that it was judged inoperable. No secondary disease in the axilla could be detected but the patient was so stout that large nodes might have been present. She was treated with radium only and except for a depressed scar in the position of the tumour she shows no trace of her disease nine years later.

When this series of fifty trials of interstitial radium had been completed it was felt to be justifiable to extend the method to treatment of earlier stages of the disease, and from that time to this I have systematically used radium either by itself or in combination with very conservative surgery. The radium has always been applied interstitially in the form of needles, the general principle being illustrated in Fig. 3.

Method of Treatment

The technical details have been described elsewhere (Keynes, 1929, 1932) and need not be repeated here. At the present time the whole breast area is treated with long needles, each containing 3 mg. radium element placed in parallel series from each side and overlapping in the centre. The axilla is irradiated with from four to seven needles, two of which can be introduced into the apex of the axilla through the pectoral muscles. Care is taken to avoid placing a needle in too close proximity to the neurovascular bundle. Three shorter needles are introduced into the area above the clavicle, and, lastly, one of the shorter needles is placed in each of the upper three or four intercostal spaces. Recently, however, I have felt doubtful about the necessity for intercostal irradiation in most patients, and, as these needles are apt to cause pain, I have been tending to omit them. My experience shows that intercostal recurrence is exceedingly uncommon, and in view of Gray and Woollard's work it seems improbable that lymphatic dissemination takes place readily in that direction in the earlier stages of the disease unless it has started at the periphery of the inner part of the breast. The needles are usually left in position for seven days. No radon has been used. Surgical operation, if employed at all, has preceded irradiation, and has been done with the diathermy needle. No dissection of the axilla has ever been carried out, though occasionally an infected gland close to the axillary tail of the breast has been removed.

The patients were carefully observed, and in due course a certain number of failures were noted. These failures were either shown by incomplete disappearance of the primary tumour or by the appearance of recurrent nodules in the breast or in the skin. In a number of patients these residual tumours were removed and examined nine months or more after the irradiation. It was then found that in 50 per cent of them no discoverable cancer remained, the tumour consisting entirely of fibrous tissue. In the other 50 per cent there was evidence of active cancer. This result led to a reconsideration of the procedure, and it was realized that the failures might reasonably be attributed to the physical limitations of radium needles. The penetrating power of the rays is strictly limited, and many of the tumours were too thick and bulky for the gamma rays to penetrate them effectively from below, so that the cancer cells in the centre or at the surface did not receive a lethal dose. Another more theoretical difficulty was the supposed variation in the sensitivity of the cancer cells themselves. I do not attach much importance to the second consideration, but the bulk of the tissue to be irradiated did seem to be a serious obstacle unless the dosage of radium were to be greatly increased, and to this there were other objections. I therefore decided to remove more frequently either the tumour or the breast before irradiation, according to circumstances. Sometimes in the earliest stages of the disease it was desirable to remove the tumour in order to establish the diagnosis. Whenever an operation was done it was as conservative as circumstances would allow, and never was it allowed to extend to removal of the pectoral muscles or dissection of the axilla. In the majority of patients therefore the amount of mutilation was negligible, and, for some, radium was still alone employed without any operation at all. This procedure could only be justified if it was clear that the effect of radium on the axillary lymph nodes was good. It may be stated at once that close observation of the patients over many years has shown that the results in the axilla have been uniformly good. Large axillary nodes have been made to disappear almost with certainty, and they have not recurred. If the axilla did not contain palpable nodes none have developed afterwards. These facts have crystallized the procedure at the present time as follows:

1. Local removal of tumour if it is large or the diagnosis is uncertain, followed by radium.
2. Local removal of the breast if the tumour is very bulky, followed by radium.
3. Never dissect the axilla.
4. Radium by itself may be used (*a*) if the tumour is of moderate size and the diagnosis certain on clinical grounds, (*b*) if the patient refuses operation.

No patients have been treated without histological proof of the disease unless the diagnosis was quite plain from the clinical signs.

If the disease has extended to the supraclavicular nodes when the patient is first seen, this has usually been found to be accompanied by disease within the thorax, so that the patient will often be unsuitable for treatment by radium which, like surgical operation, is essentially a local form of treatment. Apart from the obvious necessity of sometimes rejecting those who showed evidence of metastases in viscera or skeleton, there has been no selection of patients.

Statistical Results

Before considering the figures emphasis may again be laid on the fact that interstitial radium treatment is strictly comparable to surgical operation in that it is a local form of treatment although it can be extended to the area above the clavicle which is not usually included in an operation For this reason no startling improvement in the survival rate was to be expected if radium were used as an alternative to surgery It is the metastases and not the primary disease that usually cause the death of the patient and for that reason I never shared the exaggerated hopes that were at one time placed by some people in the future of radium On the other hand some local advantages were to be expected if the general results seemed to justify its use

For statistical purposes I have divided the patients into the usual three groups

Group I—Disease apparently confined to breast

Group II—Disease apparently confined to breast and axilla

Group III—Disease advanced or inoperable

The statistical results have been very kindly prepared for me by Lady Lorber who as Miss Janet Lane Claypon did so much statistical work on cancer for the Ministry of Health and reliance may therefore be placed on their accuracy

The total number of patients treated by me at St Bartholomew's Hospital at the Mount Vernon Hospital Northwood and privately up to the end of March 1937 is 325 Of these the patients treated within the last three years must be excluded This leaves 250 as the total available for statistical examination They are distributed as follows among the groups Group I 85 Group II 91 Group III 74 Total 250

The net percentage survival rates among my patients have been ascertained by Lady Lorber to be as shown in the following table

	Group	Number	Net Survival	U.C.H. Survival
At three years	I	85	81·5	79·2
	II	91	51·2	51·3
	III	74	31·4	—
At five years	I	85	71·4	69·1
	II	91	29·3	29·5
	III	74	21·6	—

cent for the same periods and probably it is fair to assume that in round figures 80 per cent and 70 per cent may be regarded as average results with the best surgery My figures for radium are slightly above this average I should attach no importance to this small difference were it not for the fact that the statistics in this group are weighted heavily against me When Group I relates to the results obtained by the radical operation the contents of the axilla have been removed and examined histologically so that those patients having infected nodes which were not clinically palpable have been eliminated My Group I on the other hand is necessarily a clinical group only There can be no doubt that a proportion of them would prove to have infected nodes if the contents of the axilla were examined Group I is therefore composed in reality of a mixture of Group I and Group II patients and is more unfavourable than appears on the surface Lady Lorber tells me that there is insufficient material for forming an accurate basis on which to correct this error in grouping Such material as there is indicates that the possible error is in the neighbourhood of 27 per cent She has applied this correction to my series and she then finds that the corrected survival rate for the patients in Group I is as follows

Survival Rate in Group I Corrected for Probable Clinical Error

At three years	64·8%
At five years	86·3%

I must confess that these figures surprise me and they are only published in print with the warning that they contain an element of conjecture I think it is fair to assume however that if the correction could be accurately made the true survival rate for Group I patients would be substantially higher than appears in the table given above

In Group II the survival rates of approximately 51 per cent and 29 per cent at three and five years are almost exactly the same as the figures from University College Hospital In this group so many of the patients are necessarily doomed to die from metastases which have already started when they first come for treatment that little improvement in the survival rate could be expected

In Group III where I obtained a survival rate of approximately 31 per cent and 24 per cent at three and five years it is impossible to give any comparable figures from surgery since so many of the patients are judged wisely enough to be inoperable The survival rate that has been obtained among these patients is the more remarkable when it is remembered that they represent the group that the surgeon knows he cannot

The Survival Rate following Radium Treatment

It is perhaps idle to seek at present for any definite cause to account for the apparent rise in the survival rate of Group I patients following radium treatment I can only point out that the radical operation has a definite operative mortality It is in the neighbourhood of 3 per cent according to the University College Hospital figures Radium on the other hand, has virtually no operative mortality Up to the present time only one patient has died while under treatment and she was found to be suffering from advanced disease of the heart with failure from which she might have died at any moment This operative mortality would probably militate more against Group II patients suffering from more advanced disease than against Group I Nevertheless elimination of this mortality might make a difference of 1 per cent in Group I Secondly, the radical operation undoubtedly delivers a knock-out blow from which many patients do not really recover for a considerable time and it is possible that their resistence to the disease (whatever that may be) is lowered by the shock they suffer The shock from interstitial radium on the other hand is virtually *nil* so that here again an advantage may result, though this is theoretical Lastly, there is the complete elimination of surgical interference with the lymphatic system of the axilla I think it is not impossible that this dissection is commonly performed may sometimes disseminate the disease when it has been temporarily held up in the neighbourhood of the axillary lymph nodes Interstitial radium on the other hand irradiates cancer cells in that position without disturbing them and this may possibly be a real factor in giving a better survival rate Again this is theoretical, and I am sure that more knowledge must be obtained concerning the exact mechanism of the dissemination of cancer before the matter can be settled to our satisfaction This suggestion is put forward however particularly in view of the results from the use of radium in Group I and in view of the work of Gray and Woollard, which these authors think points to dissemination being largely embolic They even deprecate on this basis any more handling or squeezing of a cancerous breast than is absolutely necessary I have often wondered in past years, as I watched patients being examined by twenty or thirty students in succession, whether this might not be seriously affecting their expectation of life, and now it seems as if the answer may be in the affirmative Gray and Woollard are of the opinion that my suggested explanation of the improvement in Group I with radium is probably correct

Comparison with Radical Surgery

I can lay claim to speak without any anti surgical bias, since pure surgery is the chief preoccupation of my life Yet I feel that it must be the ambition of every conscientious surgeon to assist in the gradual elimination of any operation so extensive and severe as the radical operation for cancer of the breast I cannot help, therefore, being interested in noting what may be achieved apart from statistics by the conservative method I have described in comparison with radical surgery No one can deny that radical surgery often entails, in addition to an appreciable operative mortality a really hideous mutilation There is, as a rule, remarkably little limitation of strength and movement of the arm, unless the interference with the axilla results (as it not infrequently does) in an obstruction of the lymphatics of the arm with its attendant swelling and helplessness This state of affairs when it occurs is very distressing indeed Again routine radical surgery does apparently sometimes result in actual dissemination of the disease with widespread recurrences in the skin flaps and their surroundings It is impossible to escape the conclusion that radical surgery does occasionally do more harm than good Lastly and I believe very importantly there is the psychological aspect Most women know what is meant by surgical treatment of cancer of the breast and I am sure that very often they are intimidated by the prospect Surgeons constantly bewail the fact that patients will not come for treatment soon enough, very often hiding their disease until two years or more have elapsed since it was first noticed I am afraid it is the fact of surgery that is partly responsible for this attitude on the part of the patients They are afraid of it and frankly I am not surprised that they should be It is this feeling that deters them from seeking advice, and so prevents any considerable improvement in the end results such as might follow earlier diagnosis and earlier treatment in the aggregate.

Advantages of Conservative Treatment

The advantages of conservative treatment such as I have outlined are as follows The mutilation is usually slight and very often may truthfully be called negligible The Special Plate gives a few examples of the present state of patients some time after treatment

Mrs B aged 38 (Fig 4) had a nodule of growth in the axillary tail of the right breast It was excised with diathermy and radium treatment was given in August 1931 Six years later she is without signs of disease

Mrs W aged 38 (Fig 5) had a similar history The lump was excised and she was given radium treatment only She also is without signs of disease six years later There has been some contraction as the result of the disease and the treatment and the breast is somewhat elevated in comparison with the other

Mrs C aged 34 (Fig 6) was treated recently by excision of a nodule of cancer in the right breast and then by radium Eleven months later the breast is virtually normal

Mrs C aged 61 (Fig 7) had a small tumour in the upper part of the left breast The treatment was the same as in Mrs C above and one year later the breast is normal

There can be no doubt of the aesthetic advantages of conservative treatment

Mrs N aged 39 (Fig 8) when first seen had a very early carcinoma in the outer part of the right breast This was treated by excision followed by radium to the outer half of the breast only She remained well for nearly five years and then showed signs of a second carcinoma in the centre of the same breast with deviation of the nipple The patient refused operation and was treated with radium only Eighteen months after this a very small nodule in the left breast which had been under observation for some time became larger and there was a blood stained discharge from the nipple This nodule was excised and proved to be a third carcinoma and radium was inserted in the breast The patient now shows some contraction of the right breast which has had two treatments but is otherwise quite well more than eight years after being first treated She would rather have died than submit to removal of a breast and is unique in my series in having had treatment for three primary growths apparently with success

With conservative methods there is, as already stated, virtually no operative mortality and there is never any operative shock I have never seen lymphatic oedema of the arm which was due to radium If it occurred, it

was always due to metastatic disease in the thorax Widespread local recurrences after radium treatment are very uncommon, and they do not ever appear to be attributable to the treatment. Finally, a number of patients have been encouraged to undergo treatment only because they were to be spared the mutilation entailed by surgery Patients have sometimes said and written to me most moving things in this connexion, and I have no doubt that if conservative treatment were to be commonly practised it would finally have the result of bringing more patients to the benefits of early treatment, and so improve the end results

Some Disadvantages

Against these advantages of conservative treatment must be set certain disadvantages There is for example, the difficulty of the interpretation of results I have already mentioned the possibility of there being a residual tumour after treatment by radium alone, and the difficulty of knowing whether this contains active carcinoma or not In addition to this there is the post irradiation fibrosis which is apt to appear as long as two years after treatment in the positions where the irradiation has been most intense It is particularly liable to occur on the inner wall of the axilla and many of my patients have fibrous lumps in that situation which would unquestionably be diagnosed as recurrent cancer by inexperienced observers Needless excisions of these lumps and long experience have enabled me to distinguish confidently between fibrosis and recurrence, but it is clear that they introduce real difficulty in the way of widespread adoption of the method Eighteen months ago I treated a lady for a very early cancer of the breast and subsequently she returned to South America Events then took place which greatly alarmed the surgeons in Brazil, and afterwards in Baltimore though I feel sure in my own mind that the patient did not have a recurrence of carcinoma

Another disadvantage of the conservative method is the increased liability to neuralgia or "rheumatic pains in the treated areas It is true that every woman who has had a cancer of the breast is likely to exaggerate slight pains into worse ones because she always thinks that pain indicates recurrence Nevertheless, the treated areas do certainly remain for some time more likely to give rise to pain than an operation scar and the patients are to that extent more conscious of their past experiences I have never encountered among my patients a true brachial neuritis due to placing needles too close to the brachial nerve trunks I have seen it produced however in another clinic, and it must be remembered that radium needles are dangerous weapons if used with insufficient skill (but so it may be answered, is a scalpel or almost any of the instruments we are accustomed to use in surgery) Post-irradiation fibrosis may also affect the pectoral muscle and produce some degree of limitation of movement This is greater when the position of the disease in the breast or axilla necessitates placing a large dose of radium over and under the border of the pectoral muscle In treating early disease this is not necessary and the resulting limitation of movement is negligible

Conclusions

The foregoing account of a clinical investigation which has now extended over fourteen years seems to me to show that the treatment of carcinoma of the breast may justifiably be made much more conservative than it usually is, provided that the necessary facilities for irradiation are available Statistics appear to demonstrate that a definite improvement can be obtained in the most favourable group of patients by judicious use of interstitial radium alone, or of radium combined with very conservative surgery The rapid improvement in x ray technique now taking place suggests that x rays may perhaps be used as an alternative to radium according to circumstances The treatment here advocated is however conservative rather than purely radiological, and details of the technique will no doubt undergo further modification The general trend of surgery in the treatment of cancer is away from the very extensive operations formerly in vogue, and I believe that this may be found to be true of the future treatment of cancer of the breast My own results with conservative methods encourage me to proceed in that belief

TUMOURS OF BONE*

RESPONSIBILITIES OF THE PATHOLOGIST

BY

J S YOUNG, M C, M A, M D, B Sc

Professor of Pathology Queen's University and Honorary Pathologist Royal Victoria Hospital Belfast

(With Special Plate)

This is the second occasion within a year on which radiologists surgeons, and pathologists have met to discuss the same or very much the same problem At the Royal Society of Medicine meeting in January it was urged by the radiologist and by the pathologist that the closest co-operation must exist between the clinician, pathologist, and radiologist As I understand it co operation in diagnosis means nothing more nor less than a fair co ordination of responsibility, with a spice of mutual understanding and good will Therefore I should like to summarize at this meeting the responsibilities as I see them which rest upon the pathologist in respect of tumours of bone

1 Correlation of Radiography with Pathology

After every amputation of a limb for a bone tumour, and during every post-mortem examination of a subject in which there is a deep-seated or inaccessible bone tumour the pathologist should bisect the bone containing the lesion at right angles to the plane of the best radiograph available or in such other plane as will best facilitate the interpretation of the radiographs This is better done of course, after consultation with the radiologist Next the pathologist must determine the histological structure or classification of the growth And then the radiologist and the pathologist together, with the surgeon if he is interested, should correlate the macroscopical and microscopical appearances of the growth with the radiographs I need hardly say that the radiographs must be recent if the correlation is to possess any degree of accuracy If no recent radiographs

* Read in opening a discussion at a joint meeting of the Sections of Pathology Bacteriology and Immunology and of Radiology at the Annual Meeting of the British Medical Association Belfast 1937

are available it is desirable to take fresh radiographs after amputation, or post mortem as the case may be before the specimen is interfered with In this connexion I have much pleasure in expressing my warmest thanks to my radiological colleagues in the Royal Victoria Hospital—Drs Beath and Montgomery—for their inexhaustible kindness and help For the purposes of correlating radiographs with pathology there is no technical procedure which can approach the preparation of paraffin sections of the whole tumour or segments thereof approximately 4 in by 3 in if the tumour is very large These sections mounted and stained on a clean quarter plate can then be projected on a screen by means of the episcope Three examples are illustrated (1) an osteogenic sarcoma of the tibia invading the knee joint (2) an osteolytic sarcoma (Geschickter) of the femur and (3) a Ewing sarcoma of the upper end of the tibia following irradiation (positive radiodiagnostic test) In passing I may say that the application of the radiodiagnostic test in any surgically accessible and radiographically apparent bone lesion of doubtful nature always fills me with alarm The lesion in this case was a Ewing sarcoma which had been regarded clinically as a Brodie's abscess Eventually a biopsy was done and the diagnosis was returned within twenty four hours The patient aged 21, serving in the Royal Irish Fusiliers refused amputation and intensive irradiation was instituted immediately The local result was good but meanwhile a swelling slowly appeared above the knee Amputation was performed a month later and then it was discovered that the supracondylar pouch of the knee joint was filled with tumour tissue The Ewing tumour is very generally admitted to be the most radiosensitive of all bone sarcomata without exception and yet in this case extension occurred during radiation treatment The patient died five months later with widespread metastases in his skull sternum and other bones In my opinion the radiodiagnostic test is apt to postpone amputation until it is too late

I have no doubt that careful correlation of radiography with pathology is practised to a greater or less extent in all the larger centres, but the subject is important enough to bear repetition Also it has the great merit of being above and beyond criticism and controversy

2. Biopsy

When we turn, however to the second responsibility or function of the pathologist—namely, to the diagnosis of bone tumours by biopsy—we discover a violent clash of opinion In some centres, of which the Royal Victoria Hospital in Belfast is one an 'open' biopsy is carried out as a routine procedure in every doubtful but accessible lesion of bone before any major mutilating operation is undertaken In other centres radiologists surgeons and pathologists are opposed, root and branch to the procedure of biopsy on the grounds that it is dangerous, unreliable and often misleading and unnecessary If they are right it is evident that the practice of the Royal Victoria Hospital is not only wrong but dangerously wrong, if they are right we cannot mend our ways too soon

Arguments for and against Biopsy

Our first requirement is to discover the essential facts upon which we can all agree, whatever our creed We can surely agree that the diagnosis of a bone sarcoma is a matter of urgency—of greater urgency perhaps than in any other malignant tumour According to the statistics of the American Registry of Bone Sarcoma the 'five-year cure' rate does not exceed one in seven In other words radical treatment in America has been delayed beyond the time of dissemination of the growth in six cases out of seven We have no comparable statistics in this country and for all that we know our results may be worse than the American ones Evidently we must diagnose bone sarcoma earlier and earlier before we can expect any significant improvement in the prognosis following radical treatment such as amputation or wide resection We must diagnose it in short before the surgeon can diagnose it on clinical examination alone

There are only two more precise diagnostic procedures which need to be considered in the present state of our knowledge—namely radiography and biopsy The radiodiagnostic test is omitted deliberately Radiography takes precedence in the procedure of diagnosis and should never be omitted If the radiograph is convincing enough radical treatment must be carried out with the least possible delay If the radiograph is not quite convincing—and in the early stages sarcoma can be confused readily with tubercle or with a Brodie's abscess so that the stakes are a limb against a life—what are we to do? We can either perform a biopsy at once or we can wait for a month or for three months or even longer until the radiographic diagnosis is unmistakable Our choice of procedure must undoubtedly be compelled by the relative merits of serial radiography and of biopsy in respect of (*a*) danger to the patient or risk of dissemination of viable tumour cells (*b*) reliability and (*c*) necessity because these are the three respects in which biopsy is challenged and often condemned

(a) Risk of Dissemination of Tumour Cells

Biopsy is attended by the risk of dissemination of viable tumour cells because the surgeon must divide many of the vascular channels of the growth in procuring the specimen for examination Serial radiography, because it postpones amputation or resection for a variable period, is attended by a risk of the same kind No one can determine directly which of the two risks is the greater because each individual case of bone sarcoma in man is an uncontrollable experiment If, however secondary growths make their appearance at any time after the execution of a biopsy the unfortunate biopsy is invariably incriminated by the opponents of the procedure, whereas if secondary growths appear after serial radiography or the radiodiagnostic test without the intrusion of a biopsy, such secondary growths are regarded piously as an act of God This conclusion is merely a stultification of reasoning and, as I hope to show, may not be altogether just to our Maker

Before we can reasonably proceed to a critical analysis of the risks attending biopsy and serial radiography respectively in the diagnosis of bone sarcoma we must close certain gaps in our knowledge of what might be called the biological behaviour of malignant tumours of bone For example, we all know that these tumours are peculiarly liable to metastasize, but we can merely do our best to interpret the reason It is scarcely possible, even if it were prudent, to make experimental observations on any bone sarcoma directly Fortunately for our immediate purpose Nature carries out an appropriate experiment which is not uncommonly observed This natural experiment takes the form of an intrinsic tumour of the brain growing within the bony shell provided by the cranium Such a tumour may be present for months or for years, for all that we know, and may be symptomless so long as its growth can be compensated by adjustment of the

cerebrospinal fluid As the growth proceeds beyond this point the hydrostatic pressure of the whole cranial contents gradually rises affecting tumour and healthy brain tissue alike This increased pressure is evidenced by flattening of the cerebral convolutions post mortem The gradual and natural increase of pressure attending the gradual growth of the tumour is subject to a more sudden increase, irregularly from time to time, owing to the occurrence of haemorrhages into the growth Indeed occasionally a single large and fatal haemorrhage may occur into an astrocytoma which has been previously symptomless A malignant tumour of bone, either endosteal or periosteal, is growing under mechanical restraint from a very early stage of its development and it is a fair conclusion that its hydrostatic pressure will be higher than that of another sarcoma growing in soft tissues We all know that haemorrhages are liable to occur into the substance of a bone sarcoma under natural conditions Each of these haemorrhages must be attended by a further focal, perhaps momentary, rise of hydrostatic pressure whereby tumour cells could be propelled actively into the gaping vascular channel which had been the source of the haemorrhage In my opinion the hydrostatic pressure which we cannot see under the microscope is a far more important factor in the dissemination of viable tumour cells in a bone sarcoma than the rich vascularity of the growth which we can see This conception is not put forward as a scientific fact, because the physical problems involved are so highly complex, it is advanced as a reasonable hypothesis

We have to apply this hypothesis not to one but to two alternative surgical procedures in the execution of a biopsy First, there is the modern or improved method (Hoffman, 1931), which consists in the puncture of the bone sarcoma by a wide bore needle attached to a 20 c cm syringe, the tumour tissue is cored out and strong suction is made (Coley, 1935) There can be no doubt at all that haemorrhage will occur into the growth following such interference and that the hydrostatic pressure will rise according to the volume of the haemorrhage This method is described as 75 per cent reliable, and is merely asserted to be safe According to my view it would be better described as 100 per cent dangerous

The second or alternative method is the simple old-fashioned one of incising the periosteum or, it may be, the cortex of the bone over the bone sarcoma more or less freely and always gently Decompression should occur gradually After a short interval to ensure that the hydrostatic pressure shall have fallen a representative portion of the growth is excised with a sharp knife Blood escapes more or less copiously into the wound, but *not* into the substance of the growth Thus a rise of hydrostatic pressure is avoided According to my view this method should be as nearly as possible safe"

Let us now try to compare and contrast the risks of an open biopsy (that is one executed by free incision) with those arising from lapse of time occasioned by the requirements of serial radiography in the diagnosis of bone sarcoma Every single malignant tumour in man is an uncontrollable experiment The best that we can do is to study the operation of the factors of biopsy and of time in large scale and adequately controlled experiments with malignant tumours in animals Wood (1919) took 673 rats which had been inoculated with the Flexner Jobling rat carcinoma—an adenocarcinoma which metastasizes readily to the regional lymph nodes and by way of the blood vessels to the lungs These tumour-bearing rats were divided into three groups In the rats of Group I a portion of each tumour was excised aseptically (biopsy factor) and the skin sutured over the wound Ten days later the remaining portions of these tumours and the intact tumours of the rats in Group II (biopsy and time 'control') were excised (to prevent further dissemination from the primary site) The rats in Group III (time or serial radiography factor) were left untouched All the animals in the three groups were killed approximately five weeks from the beginning of the experiment The incidence of metastases in Groups I and II was 22 2 per cent and 21 8 per cent respectively Thus the natural liability to metastases was *not* increased significantly by the procedure of open biopsy The incidence of metastases in Group III was 32 2 per cent. Therefore in this particular rat carcinoma, under the experimental conditions stated undisturbed growth for three to four weeks resulted in a considerably higher incidence of metastases than the procedure of biopsy followed ten days later by resection Similar results were obtained with 384 rats implanted with the Crocker Fund rat sarcoma No 10 It is not permissible to translate the results of these rat experiments directly to bone sarcoma as it occurs in man, because the biological behaviour of the rat and human tumours is so vastly different For example human bone sarcoma is more prone to metastasize

We are now in a position to study the statistical analysis of bone sarcoma in man, with reference to survival, as carried out by the American Registry of Bone Sarcoma It might be mentioned that the period of this survey preceded the introduction of the modern puncture method of biopsy

Very briefly there are seventy-four "five-year cures of osteogenic sarcoma "It is interesting to note that twenty of the cases had some form of operative procedure on the tumour at periods of one day to five years prior to amputation These operative procedures consisted of single or multiple biopsies curettages, explorations, excisions, or resections (Crowell 1935)

These results have puzzled, not to say grieved, the opponents of the procedure of open biopsy How have they received them? Their lament has echoed across the Atlantic from New York to London And what has been the burden of their lament? How many more would have been alive this day *if there had been no biopsy*! Their lament comes from the very heart of their preconceived idea that an open biopsy is a highly dangerous if not a lethal procedure Therefore it is all the more astonishing from their point of view that several of the patients survived more than one exploratory operation It has been so often asserted as a fact that an open biopsy in bone sarcoma is a procedure highly dangerous to life that it is now very generally accepted as a fact without a single vestige of proof Indeed, there can be no scientific proof in this issue because no man knows when dissemination of viable tumour cells occurs in bone sarcoma except that it occurs early Surely it is unnecessary to point out that the whole purpose of the American Registry of Bone Sarcoma will be defeated if the facts it brings to light are allowed to be overthrown by a preconceived idea—even if that preconceived idea is one precious to the hearts of many surgeons, many radiologists and not a few pathologists

Scanty as the figures are they tell us that an *open* biopsy is not lethal They suggest the possibility in the light of Wood's experiment on rat sarcoma and rat carcinoma that an open biopsy may not even be dangerous

(b) Reliability of Biopsy as a Diagnostic Procedure

Every means has been used to discredit biopsy as a diagnostic procedure in bone tumours. It has been stated by some radiologists and by some surgeons that biopsy is 'unreliable and often misleading'. If there is any truth at all in that statement surely the radiologist, the surgeon and the pathologist concerned should co-operate more closely to improve their joint efforts. It has been stated by some few radiologists that radiography is a more *conclusive* diagnostic procedure than biopsy! In considering the relative merits of radiography and biopsy in the diagnosis of lesions of bone from the very outset we must avoid an elementary mistake which is too commonly made by the masters of radiology. It is not reasonable to match a pathological David with a radiological Goliath. For any fair test of the kind deplorable as such a test must always be we are bound to presume that the radiologist the surgeon and the pathologist participating in the test each knows his job. If these conditions are fulfilled it is merely absurd to continue the discussion because the microscope is an instrument of infinitely greater precision than the radiographic machine. The microscopist will occasionally make false interpretations of his material if he is human so also will the radiologist if he is not superhuman. The precision is a function of the instrument not of the man. In stating these facts I do not disparage the magnificent achievements of radiography but merely recall that like every other science, including pathology, radiography has its limitations. One would not use a microscope to diagnose a simple fracture of the humerus, let us say because that is the job of the radiographic machine. On the other hand if the fracture were a pathological one the microscope might inform the radiographic machine that the real lesion was a secondary hypernephroma and direct it to the kidneys, the radiographic machine would inform the microscope which of the two kidneys was involved. In short radiography and pathology (in the procedure of biopsy) are not rivals the two sciences are complementary, one to the other.

(c) Necessity of Biopsy and Summary

The one sure fact that we know about the biological behaviour of bone sarcoma is that it metastasizes early. Probably, but not certainly, dissemination of viable tumour cells has already occurred in most cases before a single radiograph can be convincing enough to justify any operation so radical as amputation or wide resection. Serial radiography and the radiodiagnostic test are dangerous by reason of delay in amputation. We know that an open biopsy in bone sarcoma is not lethal, and there is no direct proof that the procedure is dangerous—although it may be so in fact. On the other hand there is experimental evidence in malignant tumours of the rat that a free biopsy is probably not dangerous at all, and certainly less dangerous than lapse of time. There is a faint hope, founded on a reasonable hypothesis, that decompression of the growth may minimize the risk of dissemination of viable tumour cells by lowering the hydrostatic pressure of the tumour tissue.

If these data are acceptable it seems to me that the following routine should be adopted as a logical procedure:

(1) In every surgically accessible and radio-apparent bone lesion which might *conceivably* be a bone sarcoma by reason of radiographic appearances site age of patient and symptoms, decompression by open operation should be carried out as soon as possible.

(2) During this open operation a piece of tissue large enough to be regarded as a fair sample of the lesion should be excised carefully for the purposes of microscopical diagnosis. If the pathological report is not conclusive another piece of tissue should be excised as before with the least possible delay.

(3a) If the lesion is proved to be a bone sarcoma amputation or wide resection should be carried out immediately.

(3b) If happily the lesion is not bone sarcoma other appropriate measures should be applied.

This broad statement of policy is submitted as a contribution towards a more enlightened procedure in the early diagnosis and early treatment of bone sarcoma.

I have to acknowledge with many thanks the helpful advice of my colleague Professor K. G. Emeléus M.A. Ph.D. professor of experimental physics Queen's University, with regard to the physical principles cited in the discussion. I have also much pleasure in thanking two of my technical assistants Mr. D. Mehaffy and Mr. J. Davidson for the willing help they have given me in preparing giant sections on my behalf.

THORACOPLASTY WITH EXTRAFASCIAL APICOLYSIS*

BY

CARL SUMB, M.D.

The so-called collapse therapy in pulmonary tuberculosis has been developed mainly on an empiric basis. As far as thoracoplasty is concerned this collapse therapy should first and foremost be a cavity therapy. Cases without cavities may heal without thoracoplasty. Infiltrations in other parts of the same lung or in the other lung may disappear after collapse of the cavity.

According to our present knowledge of collapse treatment three requirements have to be satisfied by a thoracoplasty. (1) It should cause a *complete* collapse of the cavity, (2) it should cause a *selective* collapse of the cavity. (3) the operative risk should be *small* not above 1 to 3 per cent. mortality.

1. Complete collapse of the cavity should be carried out because an open uncollapsed cavity represents a potential danger of spreading the disease. The so-called immobilization of the lung by thoracoplasty with incomplete collapse has never been shown to cure pulmonary tuberculosis in a large series of cases. Our follow-up examinations of thoracoplasty patients show that cases with persistent cavities (found by radiographs) after thoracoplasty always sooner or later produce positive sputum. In patients with positive sputum following thoracoplasty a cavity in the lung is usually demonstrable by radiographs.

2. A selective thoracoplasty should be performed for the following reasons. Before operation patients with pulmonary tuberculosis have a diminished respiratory function and therefore need to preserve healthy lung volume as much as possible. The disease may affect the other lung which may also require collapse treatment. A too extensive collapse at the first operation may exclude bilateral treatment. An extensive thoracoplasty is more dangerous than a limited one (Morriston Davies, 1933).

3. In a chronic lesion like pulmonary tuberculosis a low mortality rate is essential. A high operative risk not only

* Read in opening a discussion in the Section of Tuberculosis at the Annual Meeting of the British Medical Association, Belfast, 1937.

frightens the patient but makes him postpone the operation until a terminal stage From the patient s point of view it is ' better to live with a cavity than die without one

Localization of the Cavity

This plays a part in the question of a selective thoracoplasty In 177 cases chosen for thoracoplasty 90 per cent of the cavities were localized to upper lobes only Cases with middle or lower lobe cavities had upper lobe cavities also According to this, 90 per cent. of cases need a

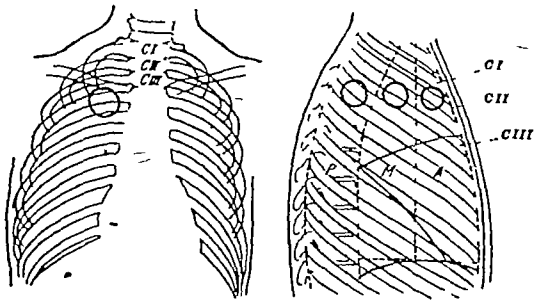

Fig 1 —Localization of the cavity Roentgen examination on two planes P = posterior area M = medial area A = anterior area

partial collapse of the upper lobe, only 10 per cent require total thoracoplasty The lateral film shown in Fig 1 is divided in three areas—the anterior, the medial and the posterior In 102 unselected cases 84 per cent of the cavities involved the posterior area of the lung mostly in combination with the medial area No cavity was localized to the anterior area only

The main question in thoracoplasty is therefore to produce collapse corresponding to the diseased part of the lung—that is, the upper and posterior region

retraction I therefore prefer the name relaxation therapy to that of ' collapse therapy The retraction of the lung by artificial pneumothorax occurs concentrically from the surface towards the hilum and this retraction takes place not only in one plane but in three planes—frontal, horizontal, and sagittal (see Fig 2) In performing thoracoplasty we should aim at mobilizing the lung in a manner similar to artificial pneumothorax, in order to enable that organ to retract concentrically towards the hilum, from the side from behind, from in front, and from above, and eventually from below

Ordinary Methods of Thoracoplasty

Sauerbruch s (1930) total paravertebral thoracoplasty produces a collapse mainly from the side This is often incomplete non selective, and even contraselective as regards the upper lobe cavities The more radical resections of the upper ribs (Graf 1936) produce more extensive and localized collapse from the side In order to obtain sufficient collapse Alexander (1932) and Maurer (1935) advocate resection of ribs far beyond the limit of the cavitation, and this makes the operation less selective The transverse processes are resected also

The practical results show that these methods, even the most extensive ones, cannot in all cases produce sufficient collapse of the upper lobe cavities The reason is in my opinion, that they fail to reproduce the mechanical effect of the artificial pneumothorax Even after the most extensive rib resection the lung remains fastened, upwards medially and posteriorly by adhesions which prevent it from retracting downwards This mechanical situation is similar to that in an incomplete artificial pneumothorax in which intrapleural adhesions above the upper lobe of the lung hinder retraction downwards, thus keeping the cavity open

In order to produce a free mobilization of the upper lobe in selective collapse the thoracoplasty should generally be combined with apicolysis The combination of

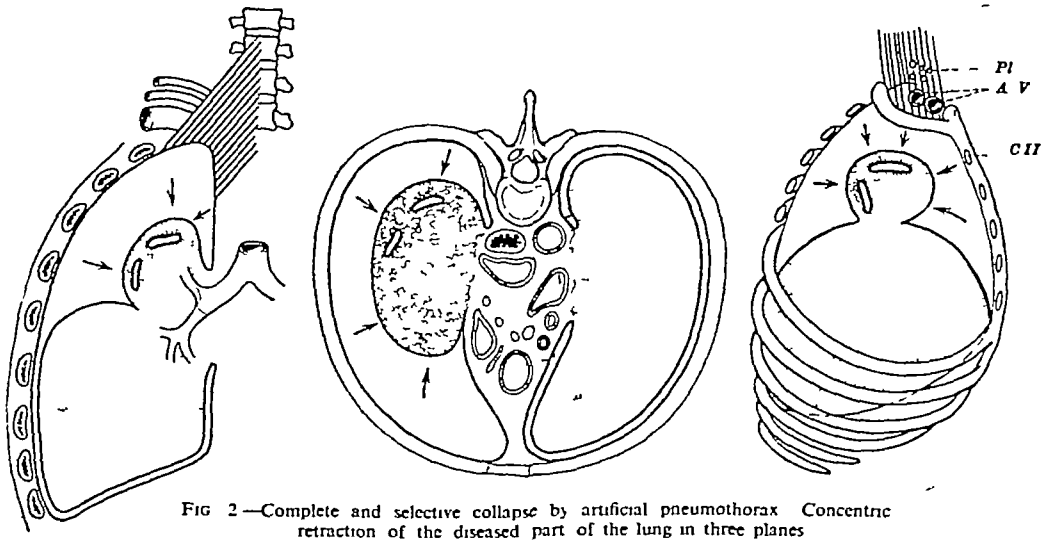

Fig 2 —Complete and selective collapse by artificial pneumothorax Concentric retraction of the diseased part of the lung in three planes

Mechanical Principles in Thoracoplasty

Of the different methods of "collapse treatment, artificial pneumothorax in the absence of adhesions at present seems to yield the best results In view of this artificial pneumothorax in my opinion should form the model for the thoracoplasty with regard to the mechanical effect on the lung The artificial pneumothorax liberates or relaxes the lung s own natural ability of spontaneous

thoracoplasty with apicolysis has been tried by Bull (1930), Lilienthal (1937), Sauerbruch (1930) Nissen (1931), Holst (1932) and Lauwers (1929) as different varieties of the so-called "extrapleural apicolysis—that is a blunt separation of the parietal pleura from the chest wall (endothoracic fascia periosteum of ribs) This method has the following disadvantages (*a*) it may be difficult dangerous or impossible to perform (*b*) it produces an incomplete collapse

(*a*) The performance of the extrapleural apicolysis may be difficult or impossible owing to peripleuritis which alters the normal anatomy about the apex of the lung, causing adhesions between the parietal pleura and the surroundings A risk of penetrating the cavity or the subclavian vein also exists I have for this reason performed the apicolysis in a more external layer, outside failure This extrafascial technique seems to solve the technical difficulties of apicolysis In cases without peripleuritis this type of apicolysis is easily performed by blunt dissection

(*b*) An extrapleural apicolysis may bring about an incomplete collapse The extrapleural cavity becomes filled with exudate and air, producing an immediately effective

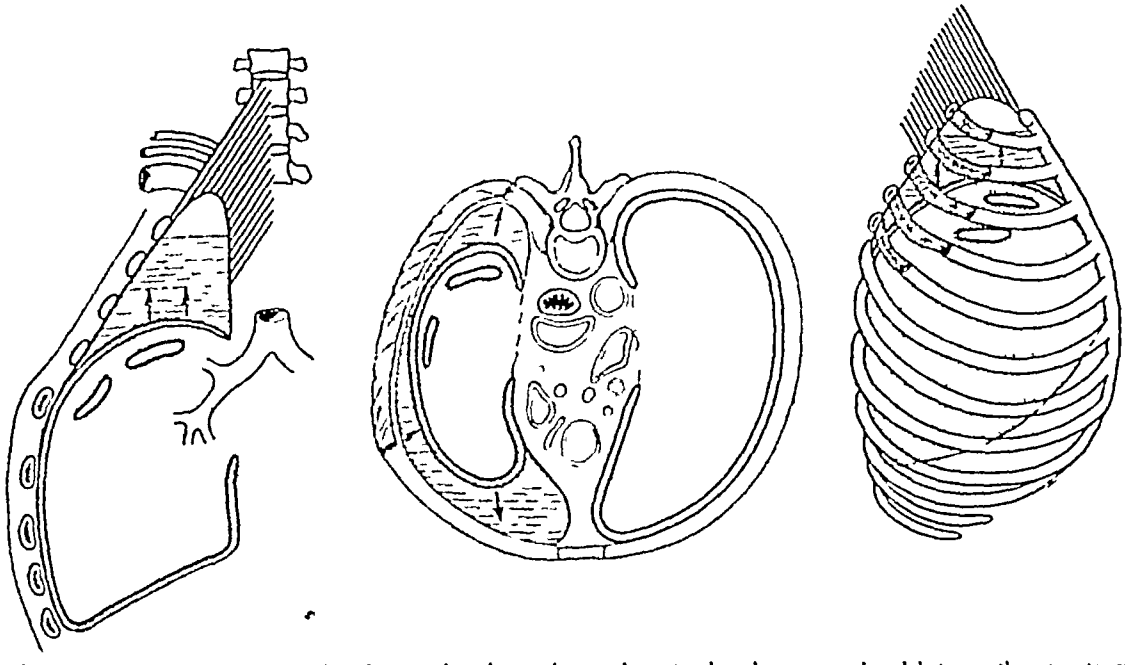

FIG 3 Thoracoplasty combined with extrapleural apicolysis—An extrapleural space produced between the periosteum of the ribs (endothoracic fascia) and the parietal pleura The lung will expand when the exudate in this space is resorbed

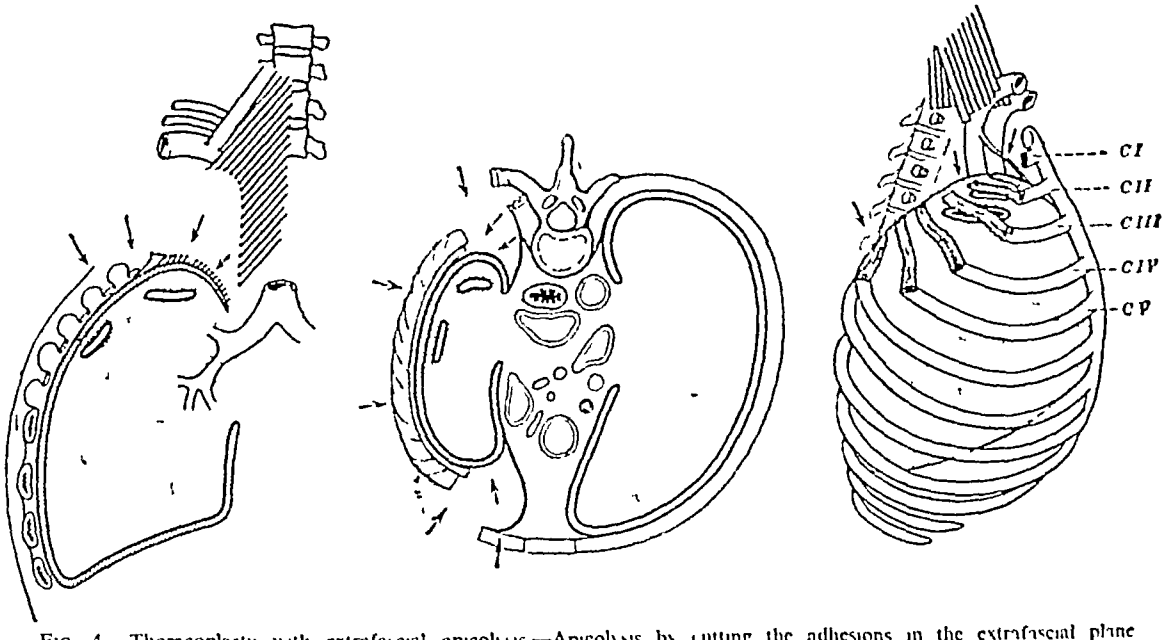

FIG 4 Thoracoplasty with extrafascial apicolysis—Apicolysis by cutting the adhesions in the extrafascial plane Radical rib resection Cutting of periosteum nerves vessels plus excision of intercostal bundles The rib periosteum retracts together with the lung regeneration of ribs fixes the collapsed lung

the endothoracic fascia in the extrafascial plane the so called extrafascial apicolysis The extensions of the endothoracic fascia which fasten the lung to the neurovascular trunk, the vertebrae and the mediastinum described by Sebilau Zuckerkandl as suspension bands,' are dissected free and divided (see Fig 4) By this procedure a radical apicolysis has been successfully carried out in a series of more than 250 cases without a single collapse In the course of some weeks the costal periosteum regenerates ribs over the exudate at a greater or less distance from the lung When the exudate is resorbed—for example after one to two months—the lung will gradually expand again towards the remaining stumps of ribs or towards the regenerated ribs These old or new ribs are to some extent 'pulling the lung out again (see Fig 3) *The ribs should therefore be resected*

thoroughly according to the extent of the apicolysis or more—that is, according to the thoracic dome Further, a dead extrapleural space should be avoided Surgeons have tried to fill this space after an ordinary extrapleural apicolysis but without definite success—P Bull by free transplantation of fat, J Holst by inserting a pedicled flap of intercostal musculature and periosteum, which had been cut laterally and posteriorly

extrafascial cavity prevent temporarily the lung from attaching itself to the surroundings and from expanding During this period, in the course of one to three months *fibrous tissue is developed from the fascia, and ribs are* slowly regenerated from the periosteum over the surface of the lung while the lung is retracted These structures keep the retracted lung fixed and prevent it from re expanding

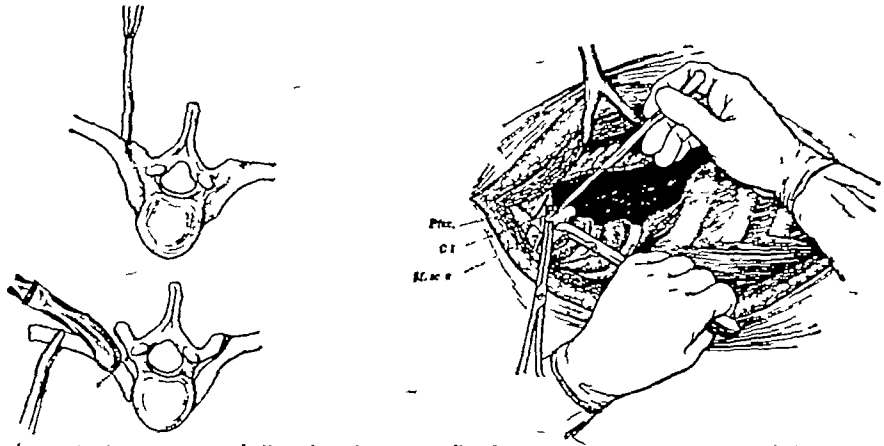

FIG 5—Radical rib resection including the whole first rib The posterior medial stumps of the ribs are resected past the point of the transverse processes after disarticulation of the costo-vertebral joint The serratus and scaleni muscles are cut above the periosteum

The periosteum of the ribs (plus the intercostal muscles, nerves, vessels, and fascia) should not therefore be stripped off to any great extent from the surface of the lung These structures should be severed from their attachments to the vertebrae and eventually from the sternum according to the extent of the apicolysis (see Fig 4) By this method we liberate a portion of the lung which is covered by the endothoracic fascia and partly by periosteum of the resected ribs and intercostal muscles These structures retract together with the lung and form the bottom of an *extrafascial space*

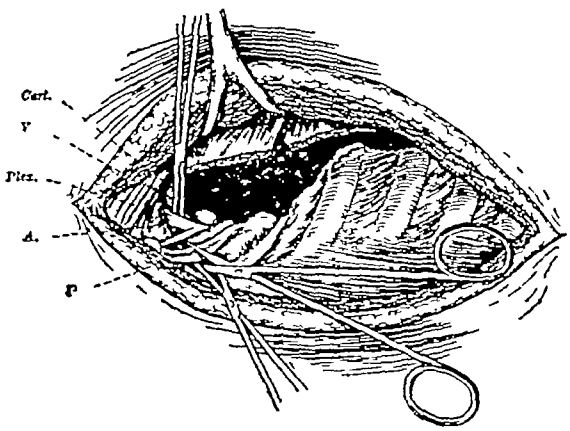

FIG 6—The extrafascial apicolysis is carried out as an open dissection The adhesions to the neuro-vascular trunk the vertebrae and the mediastinum are severed sharply or bluntly Periosteum of ribs vessels nerves and intercostal bundles are cut

Cart = cartilage of first rib V = neuro-vascular trunk Plex = brachial plexus A = Subclavian artery P = periosteum C 1

The liberated part of the lung may now develop its own power of retraction concentrically towards the hilum The retraction may take place in three planes—the frontal the horizontal and the sagittal plane—as in our model, the artificial pneumothorax The exudate and air in the

Thoracoplasty with Extrafascial Apicolysis

This method of apicolysis is characterized by three chief points

1 Apicolysis in the extrafascial plane by cutting the so-called suspension bands of the lung sharply or bluntly

2 A radical rib resection according to the extent of the apicolysis or more

3 Preparation of an extrafascial space by cutting periosteum of ribs etc in such a manner that they are not loosened from the surface of the lung

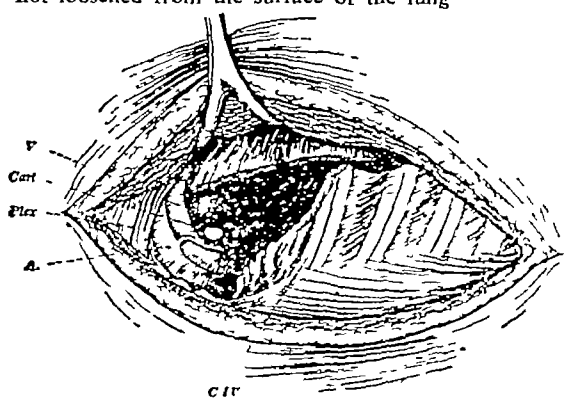

FIG 7 The extrafascial apicolysis first stage—The apex of the lung has retracted downwards 5 to 8 cm from the neuro-vascular trunk—covered by periosteum of ribs The subclavian vessels (V) the internal mammary artery and the cartilage of the first rib are seen (Cart)

This extrafascial type of apicolysis gives both relaxation and subsequent fixation of the collapsed part of the lung Our follow-up examinations have shown that the cavity closes gradually by retraction in the course of weeks or months following operation

Technique

An extensive local block anaesthesia—with 1/2 per cent novocain and 1 in 2000 pantocaine—has been successfully used. The advantages of local anaesthesia are quiet respiration, preserved power of coughing, little haemorrhage. If the patient is apprehensive it is of help to administer intravenously small doses of sodium evipan or pentothal. According to Ronald Edwards (1937) this type of local anaesthesia prevents the onset of shock.

In the first stage from three to five upper ribs are resected, usually the whole of the first, most of the second, and decreasing lengths of the third and fourth ribs (see Fig. 5). The apicolysis is carried out as an open dissection. The intercostal bundles, nerves, vessels and the periosteum of the upper ribs are cut (see Fig. 6). The adhesions or bands between the apex of the lung and the neurovascular trunk, the vertebrae, and the mediastinum are dissected free and severed. These adhesions show a rather variable development. They are normally fragile, but become dense and fibrous after a previous pericleuritis (see Fig. 7). The intercostal bundles are usually excised as they are liable to necrose. The resection of the subjacent ribs is usually performed in one or more later stages. Simultaneously parts of the anterior stumps of the previously resected upper ribs are usually re-resected. The best time for the second stage is within four weeks of the first stage. Later the regenerated ribs are resected, and sometimes two or three transverse processes.

The extent of the operation in each case should be in accordance with the localization of the cavitation, so that the collapse becomes as effective—and at the same time as limited to the diseased part of the lung—as possible. An exact radiographic localization of the cavity in two planes is therefore necessary. The lateral cavities collapse more easily, and need less rib resection and apicolysis than the lesions near the mediastinum. Young, relatively soft lesions require less radical operation than the old, stiff-walled fibrous cavitations. On account of the oblique course of the ribs a cavity situated posteriorly in the lateral plane lies more in relation to the lower ribs than a cavity localized anteriorly at the same level in the frontal plane (see Fig. 8).

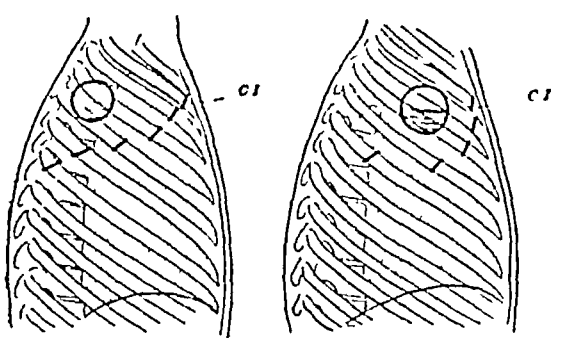

Fig. 8.—Variation of the rib section according to the localization of the cavity in the sagittal plane.

With cavities in the upper and posterior part of the lung the rib resection is usually carried down to two ribs below the bottom of the cavity. With cavities in the medial or anterior area one or two ribs less are resected posteriorly, and somewhat longer pieces anteriorly. The apicolysis may also be varied accordingly. With cavities in the medial or lower third of the lung the apicolysis should be less radical. In these cases, also, it is usually an advantage to begin the resection from above. The radical resection of the upper ribs increases the descent and thereby the collapse also of the lower ribs. Not infrequently total collapse follows upon resection of eight to nine ribs by this method.

The usual first stage varies between resection of three to five ribs and apicolysis from a posterior incision. A too extensive resection of the anterior stumps of the second, third and fourth ribs in the first stage may give severe paradoxical respiration. These stumps may be resected during the next stage if necessary. The smallest first stage from behind represents a resection of the whole of the first and decreasing lengths of the second and third ribs plus apicolysis. The first stage may be performed as a resection of the anterior parts of the first and second ribs only. The apicolysis is then performed from behind in the second stage.

Evulsion of the Phrenic Nerve

This operation should not usually be performed previous to a thoracoplasty. In the rare cases with lower lobe cavities a phrenicectomy may be indicated. In cases with upper lobe cavities the collapsing effect of phrenicectomy is very limited. A paralysis of the diaphragm also sacrifices the sound lower lobe—that is gives a contraselective collapse. It excludes the advantages of a selected apical collapse and may exclude sufficient collapse treatment on the other side if this is necessary.

Paralysis of the diaphragm increases definitely the risk of pulmonary complications after the thoracoplasty (Holst, Semb and Trimann Dahl, 1935). The explanation of this is that the suspended mobility of the diaphragm interferes with the effectiveness of cough. This diminished effectiveness may result in a drowned lung. Presence of air in the bronchioles and alveoli of the lung is necessary for cough to act explosively and force the secretion out of the bronchi. Active ability of inspiration is therefore necessary after a thoracoplasty this has been reduced by resection of ribs. This lack of inspiration following phrenicectomy explains the diminished effectiveness of coughing and the resultant atelectasis. It is a sound plan therefore, to try to avoid a phrenicectomy previous to thoracoplasty. It may, however, give effective collapse *after* a thoracoplasty.

Relation of Extent of Operation to Post-operative Reaction

Of the three requirements mentioned in the beginning of this paper two have already been discussed. The technique of the thoracoplasty with extrafascial apicolysis fulfils the two mechanical requirements for a complete and selective collapse. The third requirement necessary to maintain a low operative risk is a matter of small and several stages. Our material is well fitted to demonstrate the advantage of using small stages in this operation as both one stage and multiple stage methods have been tried.

Table I

Ribs resected in One Stage	Total No.	Dead within Two Months	Post-operative Reaction			Atelectasis
			Slight	Medium	Severe	
C. I III IV	103	2%	63%	31%	6%	4%
C. I V	53	2	55	36	9	9
C. I VI	57	4	40	40	20	25
C. I VII VIII IX X XI	43	16	39	18	21	62
Second to third stage	83	14	75	20	5	5
Total	339					

* Several cases operated on in a terminal condition.

In Table I the operations are classified according to the extent of the procedure in one stage in order to clarify the relation to the post-operative complications. The post operative mortality rate increases with the number of ribs resected in one stage, especially with resection of six ribs or more (see Table I). By operation

in two or more stages the mortality is reduced to about 3 per cent, in spite of the fact that patients who were very bad risks have undergone operation (see Tables II and III)

TABLE II—*(Total Material 1932–7) One stage and Several-stage Operations Combined*

No of Ribs Resected	Total No of Patients	Dead within Two Mths	Dead Later	Survivals	Roentgenological Control of Cavitation		Tb in Sputum		No Information
					Complete Collapse	Incomplete Collapse	Negative	Positive	
C I III IV	18	2	—	16	15	1	13	3	—
C I V	45	1	2	42	40	1	39	2	1
C. I VI	66	3	6	57	53	3	49	7	1
C I VII VIII	92	7	3	82	71	10	68	13	1
C I IX XI	25	2	1	22	19	2	19	2	1
Total	246	15 (6%)	12 (5%)	219	198 (90%)	17 (8%)	188 (86%)	27 (12%)	4 (2%)

TABLE III—*(1934–7) Operation in all Cases by Several Small Stages*

No of Ribs Resected	No of Patients	No of Operations	Dead within Two Mths.	Dead Later	Survivals	Roentgenological Control of Cavitation		Tb in Sputum	
						Complete Collapse	Incomplete Collapse	Negative	Positive
C I III IV	18	18	2	—	16	15	1	14	2
C I V	31	33	1	2	28	27	1	27	1
C I VI	29	46	—	2	27	25	2	25	2
C I VII VIII	63	129	2	1	60	55	5	53	7
C. I IX XI	8	21	—	—	8	8	—	8	—
Total	149	247	5 (3%)	5 (3%)	139	130 (93%)	9 (7%)	127 (91%)	12 (9%)

The general post-operative reaction shows similar figures The number of cases with severe post operative reaction increases with the extent of the operation With resection of the three to four upper ribs, plus apicolysis in one stage, the post operative reaction is usually relatively slight With resection of more ribs in one stage the reaction is more serious (see Table I)

Most important are the pulmonary complications The influence of the diaphragm on these complications has been mentioned Thoracoplasty reduces the breathing and coughing ability The continuity of the ribs is broken, and the active mobility, producing inspiration and expiration is correspondingly diminished Paradoxical respiration occurs due to the softening of the thoracic wall The impaired respiration and the poor support of the soft thoracic wall cause a diminished effectiveness of coughing This impaired function of the lung is dependent on the number and lengths of ribs resected and function is further impaired by a paralysis or fixation of the diaphragm A stabilized mediastinum however, counteracts and reduces this impairment

With the smallest operation (see Table I)—resection of three to four ribs plus apicolysis in one stage—atelectasis of the operated lung occurred in less than 5 per cent With resection of more ribs in one stage the occurrence of atelectasis and pneumonia increases rapidly (9 per cent., 25 per cent 61 per cent) In second stage or third stage operations the risk of pulmonary complications is small (5 per cent) provided these operations are not too extensive Accordingly pulmonary complications after thoracoplasty are as far as possible avoided by operation in small stages

Wound Complications

The large extrafascial space may become infected Prolonged drainage invites infection The wound is therefore usually closed without drainage Drainage of short duration (twelve to twenty-four hours) may be used when persistent oozing is present—for example, after the second stage After the apicolysis the intercostal bundles over the apex of the lung are liable to necrosis thus favouring infection These bundles should therefore be thoroughly excised With these precautions the infection is well controlled

The application and size of the stage in each individual case depends upon an estimated judgement of the patient's power of resistance, partly before, partly during the operation In cases with poor general resisting power the stages should be small, as the general post operative reaction increases with the extent of the operation, and vice versa The time between the stages should thus be of long duration, in order to allow the patient to recover This may have to be done in patients with febrile temperature exudative lesions of the lung myocarditis diabetes and complicating complaints, or who are over 40 years of age When a severe general reaction occurs during the operation this should be interrupted

The danger of pulmonary complications depends chiefly on the patient's power of respiration and expectoration Large amounts of sputum and large cavities increase this risk As a paralysis or suspended mobility of the diaphragm increases the risk, a fluoroscopic examination of *the mobility of both diaphragms should be carried out* before every thoracoplasty, and the size of the stage planned accordingly

Special tests have been made in order to estimate the stability of the mediastinum—for instance, by radiographs in the lateral position, etc This however, can be best ascertained during the operation by observing the occurrence of paradoxical respiration after resection of the first two or three ribs If pronounced paradoxical respiration occurs the stage as a rule should be cut as short as possible

The function of the other lung with regard to respiration and expectoration should also be investigated With reduced function in this lung—for example, through artificial pneumothorax, an extensive shrinkage of the pleura after previous pleurisy on that side, a fixed diaphragm or a pronounced emphysema—an extensive operation which reduces or suspends the function of the diseased lung, may result in insufficiency of respiration In all these cases this danger is reduced by operating in small and several stages

The relatively slight risk when this operation is performed in stages enables us to extend the indications for it—that is, perform thoracoplasty in cases which would not stand a more extensive one stage operation or a less selective one A small first stage of this operation with resection of three ribs plus apicolysis or resection of the anterior stumps of the upper ribs as previously described may be performed as a "test operation The next stage or stages may be carried out sooner or later when the patient's condition has improved sufficiently This holds good in patients who do not fulfil the usual requirements as to a good general condition, a unilateral lesion a productive phase with pronounced shrinkage, moderate amount of sputum, etc Also these patients may in this manner get the chance of a collapse therapy

Thoracoplasty versus Artificial Pneumothorax

The selective collapse and low mortality rate in thoracoplasty with extrafascial apicolysis make it even more possible than before to extend the indications for thoracoplasty to cases with artificial pneumothorax and an incomplete or contraselective collapse—for example, due to adhesions over the apex of the lung Cauterization in these cases is often dangerous and prolonged treatment

with a contriselective artificial pneumothorax gives bad late results (Sinding-Larsen, 1937) The basal artificial pneumothorax in these cases should be abandoned previous to the thoracoplasty and the lung allowed to re-expand if possible Presence of a basal artificial pneumothorax during thoracoplasty has little or no value—it is unnecessary and represents a potential danger of effusion or empyema I have no experience of the so-called extrapleural pneumolysis (pneumothorax)

Thoracoplasty versus Plombage

The collapse produced by paraffin packing may be compared to that of the first stage of thoracoplasty with extrafascial apicolysis The paraffin packing gives an operative mortality of 3 to 5 per cent while our first stage thoracoplasty hitherto has 1 to 2 per cent mortality The paraffin packing sometimes has severe late complications one year or more after the operation, with penetration to the cavity and perforation of the skin by fistulæ It may also hinder a further thoracoplasty owing to a fibrotic reaction around the paraffin The use of paraffin packing therefore, is not advisable

Results

The mortality rate within two months of operation has been reduced to approximately 3 per cent by operation in several stages (see Table III)

Collapse of the cavity and a sputum free from tubercle bacilli have been achieved in about 90 per cent of the surviving patients The follow-up examination in some cases is, however very recent (see Tables II and III)

Of all the cases 90 per cent had partial thoracoplasty with resection of eight ribs or less Only 10 per cent required total thoracoplasty

In seventeen cases artificial pneumothorax had been induced on the other side, and was present during the thoracoplasty These patients tolerated the operation surprisingly well probably owing to a stabilized mediastinum There were no deaths In fourteen of the seventeen cases complete collapse of the cavity and a sputum free from tubercle bacilli was achieved In four cases artificial pneumothorax on the other side was induced after the thoracoplasty

The operation has also been tried after thoracoplasty performed previously by other methods has failed to produce complete collapse Complete collapse of the cavity was achieved in fourteen out of sixteen patients who were operated on a second time in this way

The results of this operation so far indicate that we are moving closer towards our goal—namely (1) a complete collapse, (2) a selective collapse, (3) a low operative risk

Thirty-three special hospitals in London are making an appeal for funds on October 12, when by the sale of emblems, it is hoped to raise more than the £30,000 which these hospitals used to collect on separate flag days during the year Voluntary help is urgently needed, and any suggestion or offers of service will be welcomed by Lord Luke, chairman of the London Hospitals Collections Central Committee, 36, Kingsway, London, W C 2

CEREBRAL OEDEMA IN CERTAIN MENTAL DISORDERS

BY

C. LOVELL, M D, B S

Pathologist to Bethlem Royal Hospital

(With Special Plate)

During an investigation of the static surface tension of the serum in various diseases it was observed that the sera of some cases of mental disease presented certain peculiarities not found in the sera of normal individuals

If a normal serum be divided into two parts and one part be heated to 56° C for thirty minutes and cooled to room temperature and the two specimens be set up in capillary tubes of approximately the same diameter the surface tension reducing substances present accumulate at the concave meniscus so that at the end of three hours no further change can be detected in the next half hour and the results are then comparable If the value of the surface tension at this point be worked out there is an average difference of 4·5 dynes per cm between the normal unheated and the heated specimens These results can be reduced to terms of a standard tube of diameter 0·075 cm This standard has been chosen so as to divide the instrumental error equally between the two stages of the measurement (Lovell, 1922-3) I have occasionally seen variations in persons apparently healthy but I have never observed an abnormal serum among university students and schoolboys who were undoubtedly fit, the specimens being taken during the day from 10 a m to 6 p m

It was discovered in 1923 that a large group of anxiety cases showed no difference between the surface tension readings of the unheated and the heated specimens The mechanism of this was not clear at the time, but the method was of some use in differentiating between the katatonic stage of dementia præcox and the similar stage of acute confusional cases

About this time we examined the organs in a case of extreme anxiety in which the serum had shown the abnormal surface tension condition The patient had died of pancreatitis with hæmorrhage We cut sections of all available pancreases in the museum and divided them into the normal and the abnormal We then turned up the old case books and found that in every case in which there was an abnormal pancreas anxiety had been a prominent feature But as most of these patients had died of some inflammatory disease one was not justified in assuming that the pancreatic changes were directly connected with the mental condition Moreover, in the pancreas autolytic changes are so uncertain that it is not possible to draw conclusions from the appearance of the parenchyma Round celled infiltration and fibrosis of the interlobular tissue are the only criteria (Lovell, 1923)

A whole series of cases then came to light in which pathological anxiety as a mental symptom was associated with evidence of pancreatic disorder This was confirmed by the work of Drury and Farran Ridge (1925) and Mann (1925) on blood sugar curves To a series of 120 cases the accepted pancreatic tests were applied by Dr Macaulay Mr Majumdar, and others The tests used were the Loewi test, the sajodin test and the estimation of diastase and fat excretion The results were not always confirmatory For instance in the sajodin test the material was sometimes retained in the stomach for a considerable time owing to gastric atony, and the appearance of iodine in the urine was consequently delayed In the fat-

excretion test not only was the amount of ether-soluble material influenced by the diet, and by liquid paraffin taken in aperients but different parts of the same specimen gave different results A general survey of every available type of mental case was then made and patients showing the abnormal blood fell into three groups (1) Simple pathological anxiety (2) Agitated melancholia (3) Chronic encephalitis

At this stage we were faced with the same difficulty as in renal disease—the lack of correspondence between the clinical and the pathological grouping Is there any physical feature common to the three groups? Let us consider the question in its various aspects

1 —The Pathological Results

Of the last 2,000 patients forty nine have died and have been examined post mortem During life the serum was normal in nineteen Post mortem the pancreas was normal in seventeen, abnormal in two The serum was abnormal in twenty nine The pancreas was abnormal in twenty four No abnormality could be found in the remaining five In one case the specimens were lost The changes both in the ducts and in the interlobular tissue are often patchy in distribution (see Plate, Fig 2)

2 —The Noguchi Test in the Cerebrospinal Fluid During Life

	No of Cases	Noguchi positive	Noguchi ±	Noguchi negative
Sera abnormal	39	34	2	3
Sera abnormal but within limits of instrumental error	7	6	0	1
Sera normal	29	11	5	13

It is, however, recognized that the protein of the cerebro spinal fluid is variable and that a positive Noguchi reaction is given in many conditions

3 —The Post-mortem Appearances of the Brain

No case of simple anxiety has yet come to necropsy at Bethlem Royal Hospital In cases of agitated melancholia and of encephalitis the brains seem to form a continuous series, from the intense perivascular infiltration of the acute encephalitic to the dilated spaces with oedema of the melancholic In between is every degree of oedema and infiltration so that it is often impossible to distinguish between the two conditions

4 —The Physical Considerations

A difference of 4 or 5 dynes per cm which takes three hours to develop is difficult to check by any other method The work of Schryver (1910) led us to think that changes in viscosity of the serum such as are known to occur under the action of heat might be responsible for the alteration in surface tension on heating A series of determinations of viscosity by Wace seemed to contradict this Recently Ashby has shown that under the conditions of the experiment viscosity changes have no appreciable effect The loss of carbon dioxide from the serum may have an effect by causing a redistribution of electrolytes

A series of osmotic experiments with collodion capsules, carefully paired for equal permeability showed that in the abnormal serum the osmotic pressure of unheated and heated portions presents little or no difference moreover, the electrolyte in passing out of the capsule carries protein with it to a greater extent than in the normal This action of electrolytes has been known for a long time (Taylor, 1921 , Bayliss, 1923)

The depression of the freezing point was investigated by Wehler The difference of depression between unheated and heated portions of the same serum was, on the average, 0 02 degree in so called pancreatic cases and 0 03 to 0 05 degree in normal control cases More recently the electrical conductivity has been investigated using the apparatus designed by Ashby (1930) The initial experiments confirm these findings There appears to be a firmer union of electrolyte and protein in the cases with no range of surface tension than in the normal It will occur at once that herein lies the cause of the positive Noguchi test in the cerebrospinal fluid given by the *majority of these cases* Also the *slight oedema of the* skin noted later may be due to the same cause (Achard, 1924)

Some Italian observers claim that sulphur is to the pancreas as iodine is to the thyroid gland The daily excretion of sulphur in the urine varies within wide limits in the normal individual In a series of fifty cases examined by us the total sulphur per diem was diminished in some anxiety cases but not in all Fifteen cases showed below 2 grammes per diem and these were all cases of anxiety or encephalitis, excepting one of carcinoma of the liver

The sugar content of the cerebrospinal fluid which is raised in encephalitis and the cerebrospinal fluid chlorides have not been estimated in sufficient numbers to be worth quoting Certainly in many pancreatic cases the apparent chloride content is low, whereas it is raised in uraemic cases

The pressure of cerebrospinal fluid as shown by a manometer is not necessarily raised It is well known that the intravenous injection of hypertonic solutions will reduce the pressure in the cerebrospinal fluid of acute encephalitis *Experimentally we have tried hypertonic* enemata on three cases of the pancreatic type In each of these the patient was worse after the enema In one case in which we used an enema of gum saline the patient was definitely more confused for a time after the experiment

The fat in the faeces was estimated by Cammidge's method by the Soxhlet method, and by our own method of difference As mentioned above the normal figures vary within wide limits depending on diet liver activity medicines etc In a series of 200 cases the results are shown in the following table

Serum	Ether soluble Fraction of Faeces	
	Below 20 %	Above 20 %
Normal	67	17
Abnormal but within limits of instrumental error	32	12
Definitely abnormal	33	34

This test is of some use, however when dealing with cases in which the serum result is indefinite

At first sight there is an agreement between the figures of the ether soluble fraction and the serum figures in 67 + 34—that is 101 cases only out of 200 But my colleague Mr Bartlett tells me that statistically there is a contingency coefficient of 0.25 pointing to a definite relation between the two series of measurements

Clinical Considerations

There are three factors in the production of mental disorder heredity, mental stress and physical disease One or more of these factors are always present generally two of them Normal individuals mostly experience similar mental stresses but are able to deal with them as long as they are in good bodily health

There are many physical conditions associated with anxiety, such as renal disease arteriosclerosis, hyperthyroidism, gall stones meningitis hyperglycaemia and carcinoma The pancreatic anxiety cases present certain peculiar features The anxiety must be pathological There is generally a history of intestinal infection or gastric influenza preceding the development of the anxiety and frequently a history of diabetes in the family but only four patients in the last 2 000 have had glycosuria themselves Conjunctival jaundice is usually present An oedematous condition of the skin is the rule and the first sign of improvement is an alteration in the texture of the skin which becomes less tense The patients are very intelligent and generally good at mathematics They have insight into their condition, and are often very angry with themselves and realize the absurdity of their fears

The dividing line between simple anxiety and agitated melancholia is not defined The agitated melancholic is more liable to pigmentation (Opie 1910) which may be marked A lymphocytosis is frequent In one series of fifty nine cases with a lymphocytosis seven agglutinated some organism from the faeces In another series of ninety cases Dr W Paige of Sydney found an agglutination of *B. proteus* in three

The encephalities are of two types Those met with in practice generally show some disturbance of movement, either a pronounced paralysis or some loss of muscular control Institutional cases usually reveal disorders of conduct and are found among the schizophrenics They may show a coarse tremor or ocular paresis which may be transient and may lead to their recognition They may be katatonic or hypomanic and may ultimately present the Parkinsonian picture Like the more acute cases, they can be roused from their lethargy for a short time

Course of the Disease

Many of these cases have been followed up for as long as fifteen years The progress of the simple anxiety case and the agitated melancholic will depend so far as the physical factor is concerned, on the extent of the damage This is well shown in the photographs (Figs 6 and 7, Special Plate)

ILLUSTRATIVE CASES

Case 1—A draughtsman aged 19 developed an anxiety about his work He was fearful that his drawings would be soiled He was the last out of the office at night and was waiting in the morning for the office to open In the hospital he could always be found washing his hands and he would stand aside when the patients went in to meals to avoid contamination He was found to be a pancreatic case and was put on treatment Three nights later he woke up calling for help He said he felt something give way inside him From that time he improved he was normal in a week and back at work in a month He had no more treatment and has felt no undue anxiety since this illness ten years ago Probably this was a case of pancreatic calculus or inspissation

Case 2—A middle aged Canadian storekeeper In the middle of the night he would wake wondering whether he had closed the shop he would then dress, go downstairs, take down the shutters put out his stock and turn on the light and then put it all away again He recovered and has had no recurrence

Case 3—This patient was a young man married happily and holding a responsible post in the City His only anxiety was that he might forget how to manage his tie when he dressed in the morning He sometimes became so exhausted by his struggle with the tie that he had to lie down and rest while dressing He refused to let his wife tie it or to use a ready made tie but persisted with the struggle He then developed extensive furunculosis Under treatment he apparently recovered Two years later he wrote that he had furunculosis again and a short course of treatment put him right He has been well for three years now

Case 4—An intelligent man of about 35 Thirty years before he had stolen a few pence from his mother who had then died before the child could confess his fault He buried the pence in the street and for thirty years had been unable to pass down that street He showed anxiety on every subject and used to get his family out of the house on any pretext so that he could wash up the tea things two or three times He would take a railway ticket and explain to the booking clerk that he could not remember having asked for it He was then covered with confusion lest the clerk should think him mad Under treatment he became normal but relapsed several times Here in addition to the pancreatic condition we have the habit of thirty years I have been in touch with him for fifteen years He is blessed with a happy family and a sense of humour his anxieties have lost their sting and have become a source of household merriment in which the patient joins

Case 5—This patient was a man of middle age with agitated melancholia All lines of treatment were tried without any effect and he was discharged as a hopeless case He showed intense pigmentation (Opie 1910) and may well have been a case of pancreatic cancer

The Encephalitis Cases

With regard to the encephalitis cases we must recognize two independent phases The first is the paralytic phase The muscular wasting the oedema of the brain and I think the cerebral thromboses prior to organization can all be influenced by treatment but when we have done this we have still to deal with the second—the hysterical phase

As medical men we are seldom able to apply the discipline which so many of these unfortunate people subsequently undergo in the prisons A group of five encephalities was selected in one of these, a case of eight years duration, the serum was normal and treatment produced no effect In two cases the surface tension range of the serum was diminished, and treatment produced improvement only To a stranger these patients might have appeared normal but one slowly protruded her tongue at awkward moments, and the other developed a transient lethargy when called upon by her mother to do any work The remaining two had the abnormal type of serum and appear to have recovered completely Subsequently we have found this to be the rule So long as the serum is abnormal there is some hope of recovery, but when the serum is normal either the case is not a pancreatic case or the damage is permanent

There are many interesting problems in medicine on which this connexion between the pancreas and low grade infections seems to throw light such as the age incidence of vaccinal encephalitis but they are beyond the scope of this article The pancreatic case in general does not appear to be allergic but this condition can be produced by recurrent infection

Treatment has been by administration of extracts of gastric mucosa, by vaccines in suitable cases, by isotonic

glycerol by sulphur when this element is deficient, and by calcium salts according to the laboratory findings and the nature of the case

Summary

An abnormal condition of the serum is described which when persistent, is nearly always associated with signs of pancreatic inflammation this inflammation is generally ascending from the intestine and is patchy in distribution Glycosuria is rare Insulin is ineffective The altered blood state predisposes to oedema and to low grade infections

My thanks are due to Dr Porter Phillips to Professor Downs of Alberta whose work gave us the key to our problems fifteen years ago to my staff at Bethlem Royal Hospital who have prepared the sections and photographs and to all those who have helped by case notes and after histories and who are too numerous to mention individually in this article.

NON-SUPPURATIVE INTRACRANIAL COMPLICATIONS OF OTITIS MEDIA*

BY

ADAMS A McCONNELL, F R C S I

Surgeon Richmond Hospital Dublin Honorary Consulting Neurological Surgeon Royal Victoria Eye and Ear Hospital Dublin

It is with some diffidence that I present this paper before this Section but I have been given to understand that an unbiased opinion on the quality of alien coal can be obtained in Newcastle

The intracranial complications of otitis media may be classified as suppurative and non suppurative The pathology of the former is well established, for each stage in the process has been observed post mortem The pathology of the non suppurative complications is not so clear for the operative findings are often inconclusive and necropsies are rare These non suppurative complications are of two kinds one an encephalitic lesion which gives rise to both focal and general symptoms and the other a derangement of the amount or of the circulation of the cerebrospinal fluid resulting in the accumulation of the fluid and a rise in the general intracranial pressure

The Encephalitic Lesion

The encephalitic lesion was postulated by Borries in 1921 and by Symonds in 1927 under the terms "otogenous encephalitis and non purulent encephalitis respectively Borries held that the encephalitis was analogous to that which occurs in acute fevers and that it ran its full course without suppuration He stated that it was possible to identify the lesion at a post mortem examination of the rare fatal case Symonds suggested that the encephalitis might be the initial stage in the formation of a cerebral abscess

In general the diagnosis has been made only when recovery followed a negative exploration for cerebral abscess 'the symptoms of abscess without abscess (Borries) In this condition the cerebrospinal fluid is normal or perhaps blood stained

When a patient with otitis media presents symptoms of a focal lesion of the brain, such as aphasia hemiparesis or hemiplegia, it is wise to make a diagnosis of an abscess and to act on that diagnosis Non purulent encephalitis is rare in comparison with the purulent type If, however an abscess be not found recognition of the possibility of this condition may save further unnecessary exploration, and a decompression operation is indicated in some of these cases of encephalitis just as in some cases of abscess

Derangements of the Cerebrospinal Fluid

These derangements are of two general types In the first type an excessive amount of cerebrospinal fluid gives rise to the symptoms and signs of increased intracranial pressure Symonds described this condition in 1931 and gave to it the name of otitic hydrocephalus using the word hydrocephalus as meaning simply an excess of fluid in the skull By drawing attention to the existence of such cases Symonds rendered a signal service to otology and neurology Nothing need be added to his description to make these cases recognizable The outstanding symptoms are intermittent headache and papilloedema In spite of a high degree of pressure the patient may look remarkably well There are no localizing signs, a feature which serves to distinguish this condition from that of non suppurative encephalitis The fact of greatest importance is that the cerebrospinal fluid is normal and that there is no excess of protein or cells As there is no obstruction in the pathway of the cerebrospinal fluid the excess of fluid may be withdrawn at any point in that pathway and of course the easiest point for withdrawal is the lumbar sac One or several lumbar punctures may be necessary before the amount of fluid remains within normal limits

The second type of derangement is of the circulation of the cerebrospinal fluid rather than of its amount At some point in the cerebrospinal fluid pathway an obstruction to the circulation of fluid occurs so that the fluid is held up proximal to the obstruction If the obstruction be at the outlet from the ventricles an internal hydrocephalus results if in the cisterns of the posterior fossa one or more of these cisterns may become distended with retained cerebrospinal fluid In either case the patient then presents the symptoms of increased intracranial pressure These collections of fluid localized in the ventricles or in the cisterns of the posterior fossa demand direct removal

There are therefore two derangements of the cerebrospinal fluid which may arise in the course of otitis media (1) a general excess of cerebrospinal fluid in which lumbar puncture is safe and curative (2) a localized collection of cerebrospinal fluid in which lumbar puncture may not be safe and is not curative

Can these two conditions be distinguished clinically from each other? Cases of both types have symptoms of increased intracranial pressure but papilloedema is much more common when the fluid is in general excess than when it is localized Should papilloedema therefore be an indication for lumbar puncture?

* Read in the Section of Oto-rhino-laryngology at the Annual Meeting of the British Medical Association Belfast 1937

So far as my experience goes it is not possible to make a definite clinical diagnosis between a general excess of cerebrospinal fluid and a localized collection of cerebrospinal fluid. Statistics and probabilities do not help in the individual case. The safest way to make the diagnosis, and incidentally to treat the patient, is to perform a ventricular puncture. If there is a general excess of fluid this will remove it as readily as a lumbar puncture; if there is a localized collection of fluid in the head the ventricular puncture will furnish some indication of its position and will not carry the risk of lumbar puncture.

The clinical picture associated both with the general excess of cerebrospinal fluid and with the localized collections of fluid is usually suggestive of an intracranial abscess, and an abscess must be excluded in every case. The routine just suggested is applicable when it is necessary either to confirm or to refute the diagnosis of an abscess. The cerebrospinal fluid obtained by ventricular puncture is immediately examined and its protein content and cell count noted. A perfectly normal fluid is suggestive but not indicative of a non-suppurative rather than a suppurative lesion. Incidentally the amount of fluid obtained indicates the size of the ventricle and affords a clue to the whereabouts of any local collection of purulent or non-purulent fluid.

Conclusions

The whole matter may be summarized thus. When symptoms and signs of increased intracranial pressure develop in the course of otitis media and clinical methods fail to establish a definite diagnosis ventricular puncture is safer and more informative than lumbar puncture and should be used first. If a communicating hydrocephalus be found, lumbar puncture may then be used for treatment.

Clinical Memoranda

Treatment of Graves's Disease with Pancreatic Extract

Thyrotoxicosis is defined as a condition affecting a previously healthy thyroid gland, the cause of which is obscure and originates probably outside the thyroid, but the main symptoms are the consequence of the production of a perverted secretion in combination with an excess of normal secretion (Joll). Many theories have been advanced as to the cause and origin outside the gland, and one naturally looks for a contributory pathological condition in one of the other endocrine glands—the thymus, adrenals, pituitary, parathyroid glandules, pancreas, and the lymphatic apparatus. Pathological changes do appear in the endocrine organs, but there is doubt if they are the cause or are directly due to the thyroid disease and merely develop with it.

One cannot, however, fail to notice a very close link between the pancreas and the thyroid in thyrotoxicosis. There may be a considerable disturbance of the digestive system with prominent symptoms such as diarrhoea and icterus, looseness of the stools as distinct from true diarrhoea is very common, and is due to the very large amount of undigested fat and meat fibres—surely a pancreatic insufficiency? Severe grades of thyrotoxicosis are associated with increased appetite and thirst and loss of weight and toxic goitre may make manifest a latent diabetes or convert a prediabetic condition into true diabetes. It has been shown that functional glycosuria clears up with thyroidectomy, and true diabetes may develop if the goitre is not operated on. Again, the blood sugar is high in thyrotoxic states and in conditions of deficient pancreatic activity. A diminished output of pancreatic diastase is found in the urine in toxic conditions of the thyroid. It is well established that the fat-splitting function of the pancreas may be deficient in Graves's disease with a resulting increase of fat in the stools due to imperfect absorption a large proportion being in the form of undigested fragments. None of the other endocrine glands show such constant changes as does the pancreas in thyroid hyperactivity.

There seems little doubt that there is deficiency of iodine absorption in Graves's disease and this deficiency may arise according to Marine because there is a diminished amount of iodine in the diet or because the body for some reason requires an increased supply or because there is something which blocks tissue oxidation. The problem of Graves's disease may be solved by this simple theory that it is through pancreatic insufficiency that the necessary amount of iodine is not absorbed from the food for the pancreas has to do with the breaking down of carbohydrates fats and proteins.

As far back as 1920 I treated a case of what seemed to be a malignant pancreas with pancreatic extract; the diarrhoea, which was excessive and uncontrollable quickly subsided and the patient recovered and rapidly put on weight. This led me in 1931 to prescribe pancreatin to a severe case of toxic goitre because of diarrhoea with very light coloured stools and it was my good fortune to note that the diarrhoea was controlled at once and that there was amelioration of the syndrome of symptoms the huge goitre disappearing within a few weeks. In 1934 to help to control persistent looseness of the stools in another severe case of Graves's disease I tried the efficacy of parenteral injections of vagotonine a then newly discovered hormone isolated from the pancreas by Santenoise. This experiment has been found successful in three instances.

In May 1934 the *Lancet* published a letter with the heading "Pancreatic Insufficiency in Graves's Disease," outlining my successful treatment of exophthalmic goitre with pancreatic extract. It is interesting to note that the *British Medical Journal* epitomized an article of J. V. Kup (*Dtsch. med. Wschr.* April 3, 1936, p. 538) entitled "Skin in Thyrotoxicosis: Changes" in which it was stated that eczema due to exophthalmic goitre was cleared up with treatment by tablets containing the total extracts of the pancreas and that the manifestations of the thyrotoxicosis regressed markedly.

It is in what is now termed the primary toxic goitre that this treatment is so notably and uniformly successful although one can see amelioration of the symptoms and some change occur in the gland after lengthy treatment in the secondary or toxic adenomatous goitres. Acute or fulminating cases of goitre may be met with in which an early fatal termination may be expected where such grave symptoms occur as uncontrollable vomiting and diarrhoea (? pancreatic disease), but the common form has an insidious beginning is chronic in its course and interrupted with acute exacerbations. Many cases of incipient toxic goitre come before the general practitioner which unless he is 'goitre-minded' are labelled as neurasthenia and these are the cases which would be rapidly cured and never develop into the chronic Graves's disease if recognized and treated with pancreatic extract. Any patient who exhibits fine tremors complains of palpitation and has an increased pulse pressure without necessarily having exophthalmos or an enlarged gland should be tested with the impedance angle apparatus to clinch the diagnosis.

It may be a matter of criticism that the iodine used with the pancreatic extract in most of the cases successfully treated was the cause of the benefit accruing. Iodine medication in itself will not cure the disease, and if its administration is continued, especially in larger doses, definite increase in the syn-

drome of symptoms will undoubtedly ensue The gland itself if overtreated with iodine undergoes marked changes resembling the so-called adenomata of the nodular goitre and may partake of the characters of colloid adenomata or foetal adenomata or cysts

CONCLUSION

The treatment is a simple one and consists in the oral administration of pancreatic extract (whole gland) thrice daily before food The best preparation is that of Oppenheimer's palatinoids—pancreatin gr ½ iodine in the form of Lugol's iodine m iv or better still Oppenheimer's pulverettes alphidine is given twice daily between meals two or three days a week Over medication with iodine is to be deprecated, and in some of the successfully treated cases no (or very little) iodine was ever given Feeding pancreas has proved successful in the treatment of other conditions, and there is no reason why it should not be as beneficial orally in toxic goitre as the ingestion of uncooked or even cooked liver in the treatment of the anaemias

The patients should carry on with their usual avocations as the nervous element is such a big factor in retarding progress Cases of Graves's disease seldom do well in hospital and those awaiting operation often have to be placed in side wards to eliminate this nervous element

With this treatment of Graves's disease provided especially that the incipient cases are recognized early it may be possible to eliminate the need for thyroidectomy in the primary toxic conditions There may still be need for the operation in the secondary toxic types, or in the case of those patients suffering from primary toxic goitre who will not tolerate the tediousness of a prolonged course of treatment where dramatic results are not evident Most surgeons do not undertake thyroidectomies with complacence they feel that they are removing a structure which cannot be replaced and which has a very important part to play in the body fabric It is worth while to recall Professor C Harington's summing up in his book the *Thyroid Gland*

> The only practical means at present of handling the condition of toxic goitre consists of a palliative surgical measure devoid of any rational basis

And in discussing the possibility of lesions of the pituitary gland and suprarenal cortex in thyrotoxicosis he writes

> Neither of these hypotheses can be advanced as a serious theory of the aetiology of Graves's disease They are discussed here because it seems to the writer that it is almost certain on some such lines that the explanation of the problem of Graves's disease will eventually come

Acholuric Jaundice and Gout

Although it has long been known that there is a disturbance of purine metabolism in acholuric jaundice the association of acute gout with this disease appears to be very rare On examining the literature we have only once been able to find it recorded E Leschke (1922) described combined gout and acholuric jaundice in a patient whose father appeared yellow from childhood and whose grandfather had suffered from gout and yellow sickness probably acholuric jaundice all his life Leschke suggests that the occurrence together of these two diseases is not a fortuitous circumstance but that it is due to the excessive liberation of nucleo-proteins from the greater destruction of red blood cells This increases the endogenous uric acid formation thus establishing a condition for the development of gout In the case here recorded a family history in the father was obtained but although the mother had died from heart disease and jaundice there was no definite evidence of acholuric jaundice

A carpenter aged 26 single was admitted to St Nicholas Hospital on September 7 1936 complaining of jaundice Three weeks previously he had had an attack of abdominal pain and vomiting and became jaundiced The jaundice had persisted He said that his motions had never been pale He had had four or five previous attacks of jaundice the earliest occurring when he was 10 years old and he was admitted to Charing Cross Hospital at the age of 12 for this condition

Investigation of the family history showed that his father had died aged 63 and had suffered from gout His mother had died aged 36 from heart disease and jaundice He had four aunts all on the maternal side none of whom suffered from gout or jaundice He had no brothers or sisters

On examination the patient's general nutrition was good, the mucous membranes were pale and there was a considerable degree of jaundice The spleen was enlarged the lower limit extending to just below the umbilicus A blood count taken two days after admission showed red blood cells 3 600 000 per c mm haemoglobin 68 per cent colour index 0 94 white blood cells 9,500, differential count normal, reticulocytes, 10 per cent The van den Bergh test gave a negative direct reaction and a positive indirect reaction of 14 units The fragility of the red cells was increased haemolysis beginning at 0 7 per cent and being complete at 0.3 per cent NaCl 50 per cent of the red cells were haemolysed at 0 48 per cent NaCl (normal 0 4 per cent NaCl) The Wassermann and Kahn reactions were negative A radiograph of the abdomen revealed three well-defined gall stones

On September 24 1936 seventeen days after admission the patient felt depressed and irritable At one o'clock in the morning of the 25th he awoke with acute pain in the right big toe so severe as to require morphine to relieve it On examination the right hallux was found to be red hot swollen and extremely tender, the swelling being most marked in the metatarso phalangeal joint region It was undoubtedly an attack of acute gout The condition responded well to a colchicum mixture and local treatment with lead lotion The patient recovered from the acute stage within twenty four hours and the swelling of the joint gradually subsided during the next five days

Frequent blood examinations were made showing after a temporary improvement an increase in the anaemia with persistence of the jaundice It was decided therefore to perform a splenectomy and this was done by Mr R A V Lewis Lloyd on November 7 1936 A blood transfusion was given a week previously and a second during the operation Seven days later the patient had a slight return of pain in the same joint as before which again responded to a colchicum mixture He made a good recovery from the operation the jaundice disappeared and he was able to resume work An examination of the blood on February 24 1937 showed the following count red blood cells 4 750 000 per c mm haemoglobin 100 per cent colour index 1 05 white blood cells 11 000 per c mm reticulocytes were less than 1 2 per cent The increased fragility of the red cells was still present The patient has had no further attacks of gout

We are indebted to Sir Frederick Menzies medical officer of health for London for permission to publish this case

PHYSIOLOGICAL FOUNDATIONS

The Physiological Basis of Medical Practice A University of Toronto Text in Applied Physiology By Charles Herbert Best M A, M D, D Sc Lond I R S (Canada), F R C P (Canada) and Norman Burke Taylor M D, F R S (Canada), F R C S Ed F R C P (Canada) M R C S, L R C P (Pp 1,684 398 figures 45s) London Baillière Tindall and Cox 1937

That Drs C H Best and N B Taylor should fill more than 1,500 pages concerning *The Physiological Basis of Medical Practice* is in itself evidence of the increasingly close association between physiology and medicine which has characterized this century Of their competence for the task there can be no question for they have played an important part in the achievements that have made the department of physiology in the University of Toronto famous In their preface they clearly state their aims, which are or should be those of all who dwell on either side of the border between physiology and medicine As the various bodies concerned with the revision of the curriculum are fully aware, the medical student does not always realize how great has been the part which physiological discoveries have played in the progress of medicine and that the practice of to-day has evolved from the theories of yesterday While rightly claiming for physiology the credit for much advance in medicine, the authors are not oblivious of what Sir Archibald Garrod called the debt of science to medicine, and as they say, several examples could be cited of clinical investigations which have pointed the way to the physiologist

Anatomy, physiology, and pathology each in turn became the principal aid on which medicine relied These stages are well seen in the changing nomenclature of certain diseases—thus locomotor ataxy describes the leading clinical symptom, while tabes dorsalis implies a knowledge of the structure and functions of the spinal tract, disturbance of which is responsible for such symptoms Finally we were able to refer this to a degeneration of the lower sensory neuron through the agency of the syphilitic toxin Here clinical observation anatomy, physiology, and pathology are seen in their normal sequence, not contradicting but confirming each other Morbid *anatomy* has reached as far as we can expect it to go and, as our authors say, the student of scientific medicine is directing his attention more and more to morbid *physiology* in his efforts to solve clinical problems Sir Humphry Rolleston recognized this when as Regius Professor of Physic at Cambridge he instituted a course of lectures entitled "Morbid Physiology' In its turn physiology is becoming increasingly biochemical It is curious to find Sir James Goodhart writing just a quarter of a century ago I met a hybrid the other day—a biochemist

But the older sciences are not failing to provide us with new conceptions The recognition of the nerve unit—the neuron, contiguous but not continuous with other neurons—has gradually revolutionized much of neurology More recently the idea of an organ as a localized structure has been expanded to include structures widespread throughout the body such as the erythron and the reticulo-endothelial system within that definition Full justice is done to such conceptions in the book before us

To particularize a little, we were struck with the brief but helpful account of cholesterol and its metabolism—still a somewhat elusive subject Not only is it suggested that this may prove the "mother substance" for such important compounds as the bile acids, oestrin, the luteal hormone and the male sex hormone, but the writers go on to say, 'The only means by which arteriosclerosis can be produced regularly is by diets high in cholesterol' This has an important bearing on the observation that the high fat, low carbohydrate diet in diabetes appears to accelerate the production of arteriosclerosis even in young diabetics Again, it is interesting to learn that in diabetes insipidus the ingestion of large quantities of water with a temperature below that of the body necessitates readjustment of the heat regulating mechanism, hence vaso-constriction as a compensatory measure to conserve heat The resulting sense of cold excites shivering which may cause a rise in the basal metabolic rate the food intake is increased in consequence If pituitrin is given without restricting the fluid intake to such patients water intoxication may result

One reflection arises from perusal of these pages scientific controversy is often not wasteful of effort but may be highly productive Thus the controversy between Stewart and Cannon not only led to a revolution of our ideas on the functions of the adrenal cortex but confirmed the emergency action of adrenaline The dispute as to rickets being a disease of diet or of the dark paved the way to discoveries of great importance When disputants are equally ardent in their search for truth honours are equally divided in the long run

The book is a storehouse of information lucidly stated and valuable to physiologist and clinician alike But, quite by the way, we hope that in a future edition Dr H G Turney will not be deprived of the credit of first describing the condition now known as Cushing's syndrome in favour of some hypothetical being called Turner on page 1156

PARASITOLOGY

Précis de Parasitologie By E Brumpt Fifth edition Two vols (Pp 2 140 1 085 figures 4 coloured plates Brochés 170 fr reliés toile 200 fr) Paris Masson et Cie 1936

Perhaps nothing is better calculated to give an idea of the rapid accumulation of knowledge in any branch of science than the growth in size of successive editions of a textbook on the subject This is well exemplified by the appearance of the fifth edition of Brumpt's *Précis de Parasitologie* Ten years ago the fourth edition consisted of a single volume of some 1 450 pages the present issue, in two volumes runs to nearly half as many pages again In his preface the author refers to the many advances in more recent years in the domain of parasitology such as the recognition of new species, the demonstration of previously unknown evolutional cycles the discovery of new hosts and modes of transmission and draws attention to some of the newer means of investigation and the results obtained by experimental methods All these have been incorporated while the section on mycology has been entirely remodelled and greatly augmented to bring the present edition right up to date

Professor Brumpt is to be congratulated upon the enormous task he has accomplished—even though, as he tells us, he could not resist the temptation on several occasions to abandon this exhausting labour in order to take some repose by turning to research work and travel Everyone who is interested in parasitology is already familiar with the earlier editions and the method of presentation of the subject matter therein It is not, therefore, necessary here to say more than that the possession

of this last edition is a *sine qua non* The index is excellent, while the text references to authors with dates of publication are in themselves a feature of great value The text figures, ample in the previous edition have been increased from 850 to 1,085 in number Here and there minor points may be noted which could be amended with advantage To give a single example—the differentiation of the treponema of yaws and that of *syphilis* is not very clearly stated nor the question of cross immunity well presented, bismuth is not mentioned in treatment

MORTALITY RATES OF JEWS AND NON-JEWS

Tod und Todesursachen unter den Berliner Juden By Dr Franz Goldmann and Dr Georg Wolff with a foreword by Dr E. Seligmann (Pp 82) Berlin-Charlottenburg Reichsvertretung der Juden in Deutschland 1937

Drs F Goldmann and G Wolff have published an analysis of the rates of mortality of confessional Jews in Berlin which is of considerable value The authors obtained particulars of 14,083 deaths of confessional Jews occurring in the two triennia 1924–6 and 1932–4 The totals agreed reasonably well with those recorded in the municipal yearbooks—for the former period the deaths of which particulars were obtained were 2 per cent and for the latter period 8 per cent too few, for 1924–6 age standardized rates of mortality could be computed The authors have accordingly made a complete analysis the exactness of which is guaranteed by Dr Wolff's high statistical reputation The general rate of mortality of the Jewish population was appreciably less than that of the whole population strikingly so under the articles of infant mortality and mortality from tuberculosis On the other hand the mortality of Jews from diabetes, diseases of the circulatory system—especially arteriosclerosis—and suicide was above the average It is possible, we think, that the striking difference in respect of arteriosclerosis might be modified by age standardization but the data relate only to 1932–4, so that standardization was impracticable

The authors rightly decline to draw any decided conclusions as to the respective shares of racial predisposition selection and economic circumstances in the production of these differences From one of their findings others may be inclined to draw an inference In 1924–6 the suicide rate in Jewish males was 1.2 and in Jewish females 1 3 times that of the general population In the period 1932–4 suicide had increased among the Jews much faster (almost 50 per cent) than among the non-Jews

PRE NATAL AND POST-NATAL CARE

Pre Natal and Post Natal Management By J St George Wilson M C., M B., Ch M F R C S F C O G (Pp 206 80 figures 10s 6d net) London E Arnold and Co 1937

Mr St George Wilson has written a little book which will probably meet with wide acceptance and may even become an obstetric best seller The author writes as a clinician not too much hampered by a scientific outlook but keenly interested in the treatment of symptoms and convinced of the importance of giving serious consideration to conditions which are too often dismissed as minor ailments He clearly possesses the gift of keen clinical observation and men of experience may well find some of his "tips" to be worthy of their consideration Confident advice is given about almost everything and one of the great attractions of the book to the junior practitioner will be that if he follows Mr Wilson he need seldom if ever be in doubt as to what is the best thing to do The advice is given for the most part in terse sentences which are often so unconventional in construction as to arrest the reader's attention for their form as much as for their import The author writes on page 36 We do not believe in physical exercises which allege to prepare for labour , the meaning is obvious and if the shades of all the grammarians are made to shudder—what of it? As a rule the author wastes no words and it is regrettable to find such a trite remark as 'the abdomen will vary in appearance with the period of pregnancy

Like most good clinicians Mr Wilson does not disdain the empirical and it is greatly to his credit that he has himself tried out all or nearly all, the methods of treatment which are discussed It is therefore unfortunate that mention should be made of the treatment of hyperemesis by rectal injections of the patient's urine a method reminiscent of the unpleasant empiricism of the Middle Ages On the whole the author's methods constitute a happy combination of the old and the new thus in the treatment of secondary anaemia in pregnancy chief reliance is placed on the trusty and well tried Blaud's pill which is recommended in doses rising to 225 grains a day but violet ray therapy is also advised as an adjunct to treatment with iron An excellent example of careful clinical work will be found in the chapter dealing with the management of varicose veins in pregnancy a subject which few obstetric writers have thought it necessary to deal with, yet it is of great importance to the health and working capacity of the mother The considerable number of x ray photographs are all of uncommon excellence and are without exception a help, not a puzzle to the reader those which depict malformations of the foetal skull may be selected for special praise

To subject the book to descriptive analysis would be unfair to prospective readers, whose appreciation of a somewhat uncommon effort will be all the greater if they approach it in an expectant frame of mind We feel confident that junior practitioners and all who are working in ante natal clinics whether doctors or midwives, will find in it a most useful mentor and guide

CONTROL OF TUBERCULOSIS

The Control of Tuberculosis in England—Past and Present By G Gregory Kayne M D., M R C P D P H Foreword by Sir Humphry Rolleston Bt G C V O K C B (Pp 188 8s 6d net) London Humphrey Milford Oxford University Press 1937

Dr Gregory Kayne in the course of his Dorothy Temple Cross Fellowship was able to make an excellent survey and has now published this in book form The chequered story of pure administration is always regarded impatiently by the clinician It is debatable to what extent progress is owed to scientific discoveries and how much to the application of them by sociologists and legislators Tuberculosis is an endemic infection with waves of epidemic incidence corresponding with industrial and social aggregations What Society creates Society can control and presumably the ancient Pharaohs could have been protected against death from the tubercle bacillus by measures similar to those described in this book

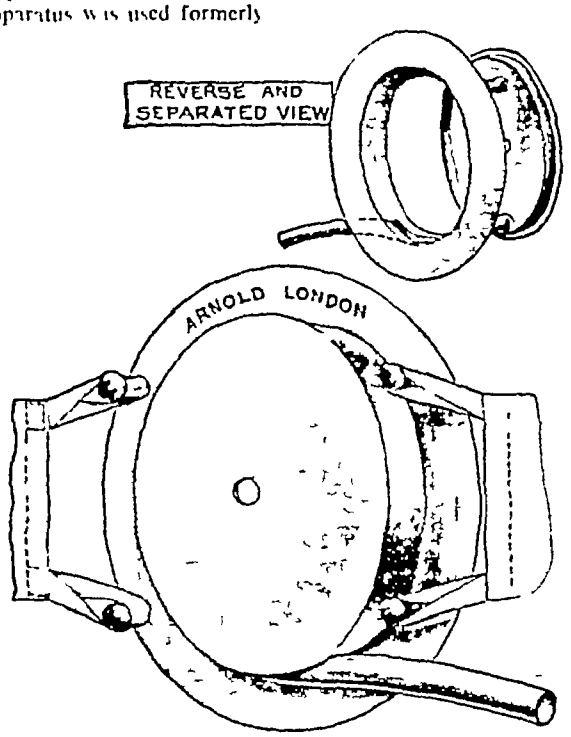
Dr Kayne begins with the voluntary system which preceded the first official recognition of tuberculosis in 1908 Haphazard treatment in special hospitals the building of small sanatoria for the well to-do patchy pursuit of clinical interest were the features of the early period The poor had only the out patient department the rich went to Madeira and Switzerland The Edinburgh Dispensary was founded in 1887 but the example did not spread very much until the beginning of the great war The infectivity of the disease was not really accepted in Government

circles until 1908 and notification did not become compulsory until 1912 Lord Astor's committee established the tuberculosis scheme as we know it to-day with dispensaries, sanatoria hospitals and settlements In the beginning national health insurance made funds available but latterly seems to have dropped out of direct connexion with the tuberculosis scheme Dr Kayne's book describes all these developments faithfully and without prejudice In the last section he turns to the future and gives a sketch of its possibilities He plumps for the periodic examination of healthy people with more radiology and closer contact with the general practitioner 'Sooner or later the preservation of the health of the population will come to be regarded as on the same footing as national defence or police supervision and a complete health service will be available for every citizen who falls ill in the same way as the police serves now when he is attacked or threatened by others Dr Kayne has more confidence in the present voluntary system than this statement would seem to suggest He is probably correct in thinking that the English mind will evolve an amalgam of State and private practice without an extreme

In a book dealing with administration it is perhaps too much to expect adequate attention given to research Is not this where much of our vaunted administration fails? The tuberculosis scheme has evolved out of humble beginnings in a few voluntary hospitals and wooden sanatoria hidden far away from towns into a fairly adequate system of control of contacts and actual cases Any person who has suspicious symptoms may be referred to a dispensary for expert examination Treatment has reached a high level and social care is beginning to be understood What of research and future development? From Dr Kayne's book we have the feeling that our national tuberculosis scheme will go on extending in its blind planless fashion He is likely to be right A writer on English administration who fails to give the impression of extraordinary inchoate and illogical development would not be stating the facts and Dr Kayne's book is an excellent one for this reason as well as for its accuracy and completeness

Notes on Books

Digitalisfibel fur den Arzt (Berlin J Springer, RM 1 80), by Professor Ernst Edens is a brochure of some thirty pages into which the author has condensed the essential facts regarding digitalis which he rightly claims is the most indispensable weapon that the general physician possesses The information is set out in seventy-five paragraphs, and an account is given of the history, chemistry, pharmacology, and therapeutic use of the drug The account is supplemented by a list of 120 selected references The author himself has done much to advance our knowledge of digitalis and his opinions are based on many years of clinical experience Hence the synopsis is of more than usual interest for it shows which facts a leading authority considers to be really essential



Grundlagen einer neuen Therapieforschung der Tuberkulose by Drs W Pfaff and Willy Herold (Leipzig G Thieme, RM 17 80), is a monograph in which the authors give an account of investigations undertaken to determine the mode of formation of tuberculous lesions The first half of the volume gives a general review of the pathology of inflammation with special reference to infection with the tubercle bacillus The second part describes experiments carried out by the authors They used fluorescent vital stains and studied the passage of these out of the blood vessels with ultra violet illumination The third part reviews the methods available for checking the growth and spread of tuberculous infections

Preparations and Appliances

A SUPRAPUBIC BOX

Mr Charles E Kindersley F R C S (Bath) writes

The suprapubic box illustrated in the accompanying figures has been made for me by Messrs John Bell and Croyden, Wigmore Street London W 1 It is used wherever an Irving apparatus was used formerly

The outlet tube at the lower extremity of the box is attached to a suction apparatus and eliminates the urinal between a patient's legs and enables the patient to move freely in his bed

I have now been using this appliance for several years in prostate cases and find it is possible to keep a patient perfectly dry and at the same time to allow unimpeded mobility in bed

ZINC PROTAMINE INSULIN SUSPENSION

80 units per c cm

In response to a demand from users of protamine insulin (with zinc) for a preparation of higher unit value than the 40 units per c cm the four British firms engaged in its manufacture (Allen and Hanburys Ltd Boots Pure Drug Co., Ltd., The British Drug Houses Ltd and Burroughs Wellcome and Co) have now made available a suspension containing 80 units per c cm This preparation is issued in one size only—5-c cm vials containing 400 units (80 units per c cm) The original preparation containing 40 units per c cm will continue to be issued as at present in 5-c cm and 10-c.cm vials

STREPTOCIDE OINTMENT

Streptocide ointment (Messrs Evans Sons Lescher and Webb Ltd) contains 5 per cent of *p*-aminobenzenesulphonamide dissolved in a bland neutral ointment base. The remarkable disinfectant action of this drug on haemolytic streptococci is well known and clinical trials indicate that the drug is effective on external application against these organisms when present as surface infections

BRITISH MEDICAL JOURNAL
LONDON
SATURDAY OCTOBER 2 1937

"A CALL TO THE NATION"

By the time these words appear in print the Government's National Health Campaign will have been launched by the Prime Minister in a speech broadcast to the nation The main objectives of this campaign, which is organized on behalf of the Minister of Health and the President of the Board of Education by the Central Council of Health Education, the cost being borne from public funds, are "to encourage the wider use of the existing health services and to bring home the need for increased physical fitness"

No student of the history of medicine and the development of medical organization can doubt that any project, scientific or administrative, which is likely to raise the standard of public or personal health can count on the whole hearted support of the medical profession Of the informed and stimulating contributions to the public health by special committees established by the British Medical Association some recent examples strikingly illustrate this fact The reports on nutrition translated the findings of physiology into factors of domestic economics at the same time focusing public attention on the first essential of bodily health, good nutrition, the report on physical education provided the basis upon which the Government constructed its proposals on this subject an event not too freely acknowledged that on fractures was important enough to justify the appointment of a departmental committee to give practical application to its findings the reports on immunization, on medical education, on mental deficiency, on alcohol and road accidents, and on the medical aspects of abortion, together with such pronouncements as that on the purity of milk show a catholicity of contribution to subjects of public interest It will be conceded that the medical profession alive as it is to its public responsibilities, is unusually well equipped to examine with a friendly if critical eye a national campaign to improve the public health

The projected campaign is limited in its applications it is directed to the wider use of certain existing services and those only Although there is evidence at this late stage of a tendency to widen the basis of the campaign the available literature makes it clear that it is the maternity and child welfare, the school medical, and the tuberculosis services of local authorities which in the next three months are to enjoy the bright light of publicity, although the national health insurance service is to receive mention It is legitimate to ask whether the restriction of the campaign to these services excellent though they are, is in the ultimate public interest Hospitals, voluntary and municipal, universities and research institutions, voluntary bodies and such public-spirited organizations as public medical services and provident associations, and private practitioners, both specialist and general, are all agencies contributing to national health no less than the local authority services which, by their non-domiciliary and occasional character and their limitation to isolated phases of human life history, can be of little value without the co-operation and support of these other agencies If and where such co-operation is lacking, to advocate in a national health campaign the use of certain services, chosen because they are provided by statutory authority, may aggravate a situation already inimical to the welfare of the public Perhaps the most unhappy characteristic of the existing provision for the health of the people is the lack in many areas of the appropriate arrangements for co-operation and consultation between the many workers in the field of health, notably between local authorities and the medical profession

An increase in the numbers of attendances at ante natal and infant welfare clinics, already quite high, can scarcely be regarded as being of itself a sufficient result of a national health campaign launched by the Prime Minister in what is officially described as "a call to the nation" Indeed a concentration of public attention on certain limited existing services is not without the danger that it may divert it from the consideration of the larger problems of future development, and postpone the elaboration of a comprehensive long term policy Governmental action on the lines of the report of the Departmental Committee on Scottish Health Services including the extension and amplification of the existing national health services and the creation in England and Wales of a complete national maternity service is an urgent need of the day

The Minister of Health has given abundant evidence of his courage and his enthusiasm for the public health There may be good reason for limiting present activity to the existing services But we would urge him in the public interest to widen the basis of this campaign so as to present to the public in truer perspective the problem of national health, and the many varied agencies, statutory and voluntary, individual and corporate, which contribute to it.

These figures confirm the unfortunate fact that by far the greater number of patients only apply for treatment when the disease is advanced—in some cases when treatment is impossible meanwhile the chances of success progressively diminish The following is a brief summary of five-year results

Number of Patients Treated and Five year Survivals in the Different Stages

	No of Patients	Not Treated	Five-year Survivals	Percentage
Stage I	15	—	13	86 6
„ II	41	—	20	48 8
„ III	126	—	19	15 0
„ IV	106	8	1	0.9

Of the 288 patients applying for treatment no fewer than 232 postponed seeking expert advice until the disease had made such progress that—to put it very bluntly—the expert did not have a fair chance We have repeatedly urged the need for early treatment, and no better argument could be put forward than the figures we have collected from this report Thinking it might be of interest to see if there has been any improvement in more early attendances, we have examined the figures given for the years 1932–6, but, although there is a very slight improvement, the tendency to delay seeking advice until an advanced stage of the disease still persists Summarizing these records we find that out of 250 patients presenting themselves 58 were in Grades I and II, and no fewer than 192 in the advanced Grades of III and IV The facts are deplorable but as the Radium Institute is a metropolitan hospital receiving cases from all over the country they may we think, be taken as fairly typical of conditions generally Education of the public is necessary, and can only come about with the help of the general practitioners The task is admittedly both delicate and difficult but should not be beyond those whom the public regards not only as medical advisers but as friends It would be invaluable if we could once definitely ascertain where the cause of the trouble lies

There is one friendly criticism which we are tempted to make—namely that the report as it stands hardly does justice to the excellent work for which the Radium Institute has such a deservedly high reputation Of the eighteen pages which constitute the actual medical report no fewer than sixteen are entirely devoted to statistical summaries There must be many interesting observations made in the course of a year's work which are worthy of being recorded and a brief account of some of the researches instead of a bare enumeration of the publications based upon them would have added to the interest as well as to the value of the report. If the present instance had been an isolated one it might have passed without comment, but the practice of issuing reports which are for the most part only tabulated summaries hardly tends to arouse general professional interest and will, we fear, tend to deter any reader less hardened than a specialist or a reviewer

TRENDS OF POPULATION

In his presidential address to the Geography Section of the British Association Professor C B Fawcett discussed the world trend of population since census taking became regular and widespread—that is since the beginning of the nineteenth century He pointed out that the net effect has been to add about a fourth to the major populated areas, and has not been either to spread population more evenly throughout the world or to fill up the great open spaces He examined in detail that aspect of this movement which impresses itself upon all observers—namely, the drift to towns

For many years Professor Raymond Pearl and his associates in the department of biology of the School of Hygiene and Public Health, Johns Hopkins University, have been studying the physiological aspects of the population problem and two recent memoirs[1] are good illustrations of their method of approach Briefly this is the problem The effective birth rate depends upon natural or racial peculiarities age, and exposure to risk. This last factor (assuming for simplicity that we are only concerned with the fertility of married couples) is partly determined by the use of contraceptive methods Now in a country such as the Birth Registration Area of the United States of America official statistics provide much information respecting fertility as influenced by age habitat, and racial condition, because the data distinguish not merely between white and coloured but between native and foreign-born women The first of the memoirs cited above is based on the data for 1930, and the general plan of the study is as follows If one thought of 'man' simply as a breeding mammal then in the healthy animal with unrestricted opportunities for sexual intercourse first pregnancies would be concentrated within a narrow range from the moment of sexual maturity and other pregnancies follow at regular intervals the record in individual cases would be determined by innate fertility Of course in human beings these conditions are seldom if ever fulfilled one has quite apart from the use of contraceptive methods such factors as differences in age at marriage, and actually the interval between the biologically possible and the actual date of first pregnancy in

[1] *Human Biology* 9 65 and 212 *Amer J Hyg.*, 25 '07

almost all classes of society is large Thus if one takes the reproductive span as the average period from first menstruation to menopause, it is found that in American-born whites 23 9 per cent of that span, in foreign-born whites 31 8 per cent and in coloured women 15 8 per cent elapses before the first live birth, for first stillbirths the interval is greater Professor Pearl compares in detail the actual reproductive histories—what he calls the patterns of reproductivity—and provides a number of instructive tables He has also, in the second memoir cited, compared samples of women from New York and Chicago who gave particulars respecting their use of contraceptive methods

Like other observers Professor Pearl finds that the effective reproduction of what are generally regarded as desirable elements in a civilized community is much below that of less eligible strata, and that "birth control," although by no means equally effective everywhere, has been a material factor But he is led to think that other factors, in particular deferred age at marriage, are of more significance than some statisticians have believed, and that "birth control" itself is more important "in keeping women out of the category of breeders at all or admitting them into that category only once in a lifetime" than as a method of spacing out the pregnancies of multiparae These are important conclusions from the sociological point of view, and no doubt Professor Raymond Pearl will develop his views at length in the Heath Clark Lectures which he is to deliver at the London School of Hygiene and Tropical Medicine in a few weeks' time

To an observer in Mars, without personal grounds for anxiety, the problem of population trends must be of fascinating interest He will note that, *pari passu* with a maximum of concentration in and around large cities of human beings, the means of destruction of life have been multiplied, and the power to set these means of destruction into motion has, even in democratic States, also become concentrated under the control of a small number of persons He will also note that the function of replacing the existing inhabitants of the earth is becoming specialized not merely as between races but within each community He will ask himself whether, in the event of the kind of mutual destruction of cities which Mr H G Wells foretold so many years ago in *The War in the Air*, the return to barbarism he suggested may not be inevitable A mitigating factor is that the modern city tends to enlarge its area, so that if the peoples of Europe can be prevented from flying at one another's throats for a generation, total destruction will be impracticable But such an economic or military reorganization would leave the problem of reproduction unsolved

MEDICINE AND THE PUBLIC

A report appears in our *Supplement* this week of the special meeting of the Council of the British Medical Association which was held on September 22 to consider proposals for cultivating better relations between the organized medical profession and the public Though differences of opinion as to ways and means were clearly put forward in the course of debate, the Council had no difficulty in accepting the general principle that steps should be taken to inform the community about the work of the profession more especially in the medico sociological sphere to secure a more enlightened attitude towards the problems connected with National Health Insurance and to persuade the newspaper Press to be more constructive in its handling of medical news The executive decisions taken by the Council included the setting up of a Propaganda Committee and the appointment of a public relations officer to take up his duties almost immediately It is hoped that by these and other cognate means public opinion may be informed and guided in relation to the work and views of the Association in matters that directly concern the health of the people

UPPER RESPIRATORY INFECTION IN CHILDHOOD

No apology is necessary for referring once again to the discussion on otitis media in early childhood which took place at the Royal Society of Medicine in May, 1937, and is now published in full in the current number of the *Proceedings*[1] Everyone dealing with children should be familiar with its implications Otitis media in children under 5 years of age differs considerably from the disease in later childhood and adult life Owing to their free communication, the Eustachian tube middle ear, and mastoid antrum are simultaneously involved and the infection is bilateral in approximately half the cases Spontaneous perforation is uncommon and late owing to the relatively greater strength of the tympanic membrane the width of the Eustachian tube, and the collapse and dehydration of the child The disease can therefore easily be overlooked Tuberculosis of the ear is much less often seen than a quarter of a century ago and the commonest organism is the streptococcus Figures given by Dr J H Ebbs based on 880 consecutive necropsies of children under 14, showed the surprising incidence of otitis media in infancy Infection of the middle ear is found in over 50 per cent of children who die under the age of 14 and sinusitis in over 30 per cent Of those dying in the first year of life the number with otitis media is over 60 per cent In many of these children the presenting symptoms are diarrhoea and vomiting and there seems no doubt that an upper respiratory infection is the commonest cause of alimentary disturbances in infancy Pneumonia is an even more frequent finding than gastro-enteritis and the number of cases in the first year of life is described as appalling Infection of the upper

[1] *Proc roy Soc Med* 1937, 30, 1293

respiratory tract is a 'menace to all lower-lying structures" and it may lead to tonsillitis bronchitis bronchiectasis pneumonia and severe gastro-intestinal disturbances There is no doubt that these infections are contracted from other persons and Dr Ebbs emphasizes that the contact of an adult with an infant while that adult is suffering from a cold or influenza, exposes the infant to one of the gravest risks which it can encounter during its life time A final important point is that the vast majority of infants who die of infections related to otitis media and sinusitis have been artificially fed and "the best insurance that a mother can adopt for her infant is breast-feeding whenever it is possible and particularly during those difficult first few months of life when infections are so dangerous"

ARCHIEPISCOPAL LICENCES TO PRACTISE

Mr R R James[1] has examined the records at Lambeth and has taken out the names of those to whom the Archbishop of Canterbury issued licences to practise medicine and surgery from 1580 to 1773 The work is laborious but is well worth the trouble It greatly assists the student of the history of medicine in England It enlarges his knowledge of the curious manner by which medical practitioners have reached their present qualifications and it gives personal details about the lives of some medical men well known in history Mr James with the help of Mr J Harvey Bloom published in 1935 the names of those who were licensed by the Bishops of London and by their Vicars General It now remains to do a similar service for the Northern Province of York The licences granted by the Archbishop of Canterbury appear to be in common form in Latin in the earlier days and afterwards in English It would be useful if Mr James would expand and print an example of each The licensees are described as *Professor* or *peritus* in their art Did these terms carry the same distinction as the S T P and the D D or were they merely conventional?

SOCIAL HYGIENE

The *Empire Social Hygiene Year-Book*[2] has established itself as a useful work of reference and compendium of current facts The new issue contains additional statistical tables regarding the incidence and treatment of venereal diseases an account of community provision for cripples and the blind and the public health and educational statistics for the counties and county boroughs of Northern Ireland in addition to those for Great Britain which have appeared in former years In a series of short articles the subjects of housing maternity and child welfare illegitimacy prostitution juvenile delinquency and mental defect are studied The chapter on marriage law needs revision in view of the passing of the new Act Many compact tables are given to show the exact position with regard to venereal diseases in the community Each of the armed forces shows a gratifying fall in the incidence of hospital admissions—an almost continuous reduction since 1921 The case ratio is highest in the Navy, but even there it is not much more than half of what it was fifteen years ago and the Army and Air Force show still more striking reductions In the Navy the incidence of venereal disease is highest in the China station followed closely by the African and the American and West Indian stations In the Army the incidence is greatest in the Jamaica command where in 1935 the admissions to hospital for gonorrhoea per 1 000 of strength were 134 4 The bulk of the *Year-Book* consists of information with regard to each of the counties and county boroughs concerning health social and educational services and information of the same kind has been compiled for each of the Provinces in the Dominions the Presidencies and Provinces of India and the various Colonies and Dependencies

REGIONAL ILEITIS

In 1932 Crohn of New York first drew attention to a characteristic condition of chronic inflammation in the intestine which had until then been only imperfectly recognized Since the publication of Crohn's paper numerous reports have appeared on this subject particularly in America and more recently in this country Sir Arthur Hurst[1] has recorded further cases and with Drs Colbeck and Lintott reviews the whole subject of regional ileitis or Crohn's disease The condition is one which has almost certainly in the past been mistaken for ileo-caecal tuberculosis The pathological changes are however those of a hyperplastic inflammation, resembling macroscopically a neoplastic condition but histologically similar to those of tuberculosis The inflammation appears usually in the last eight inches of the ileum and is associated with marked fibrosis adhesions and in some cases fistula formation, the bowel becomes rigid and narrowed and the clinical picture of intestinal obstruction usually develops Crohn's disease is a non specific granuloma of the intestine whose aetiology is at present unknown as Hurst points out it is by no means a rarity Crohn originally described four main clinical pictures (1) that of an acute intra abdominal disease similar to appendicitis (2) that of ulcerative colitis (3) that of chronic intestinal obstruction and (4) that of persistent fistula in the right iliac fossa The most important clinical finding is a mass in the right iliac fossa to which may be added the signs of a fistula diarrhoea and the scar of a previous appendicectomy The latter finding arises from the great difficulties which may exist in differentiating this condition from recurrent attacks of appendicitis so that a large number of cases have an appendicectomy performed The diagnosis of regional ileitis can usually be confirmed by the characteristic filling defects and narrowing of the terminal ileum often with great distension of the intestine above the

Guy's Hosp Rep 1937 87 175

lesion, found on x-ray examination The importance of the recognition of Crohn's disease lies in the successful results of surgical treatment As Hurst states, the only satisfactory treatment is operative In most cases resection of the affected area of gut is possible, and if this can be done the end-result is excellent where resection is impossible owing to the presence of adhesions or fistula, a short-circuiting operation may still give highly successful results Hodgson,[1] for instance, recently reported a patient for whom a lateral anastomosis was performed without resection seven years previously with good subsequent recovery, and in one of the cases described by Hurst recovery followed a short-circuiting operation In a discussion[2] at the Medical Society of London last year A D Wright, however, who had at that time seen eight cases, pointed out that regional ileitis had a high mortality, and emphasized the great loss of weight which may follow the obstruction and inflammation It is to be hoped, however that as the condition becomes better recognized earlier surgical treatment may lower very greatly this mortality and that the clinical features will become sufficiently known so that radiological assistance will be called in if suspicion of Crohn's disease is aroused

ADHERENCE OF TUBERCULIN TO SYRINGES

Professor E R Long and Miss F B Seibert have added one more observation to their valuable work on tuberculosis for with Dr Nielson they[3] have again pointed out the fallacies besetting the use of the same syringe for injection of tuberculin and Schick or Dick test toxins These authors refer to the uncanny adherence to glass of tuberculin and to the danger of "infinitesimal amounts of tuberculin" distorting the results of Schick and other tests done later, since the "positive Schick tests" may be in reality tuberculin reactions In one group of thirty-three children tested the syringe used for the Schick test was washed and autoclaved after it had been used for tuberculin, yet four children gave a "positive Schick test" when this syringe was employed while the same Schick toxin from a previously unused syringe gave no reaction In seven other children the 'tuberculin" syringe was associated with a 50 per cent larger reaction than the new syringe—in other words, the results in eleven children in a group of thirty-three were vitiated because of the employment of an old tuberculin syringe These writers also record that the Schick test in a young physician had become "Schick-positive"—though he was in reality Schick-negative—because a tuberculin syringe had been employed As Professor Long and his colleagues state these difficulties were pointed out previously in 1935 by H J Parish and R A O'Brien[4] who themselves after making the discovery of the extraordinary adherence of tuberculin, found that K Zeiler[5] in 1911 had noticed the same danger The important problem is How can the general practitioner make sure that his syringes are "uncontaminated" with tuberculin? The American writers say that immersion for twelve hours in sulphuric acid bichromate or boiling for ten minutes in soapy solution "seemed to have got rid of" the tuberculin, and Parish and O'Brien were unable to find a simple, reliable method of cleaning syringes and glassware Both groups of workers indicate that it is safer to keep permanently separate syringes for different dilutions of tuberculin, or to employ previously unused syringes wherever there is a possibility of confusion between tests It is obvious that the general practitioner must remain in a dilemma until the experts carry the problem further and that a number of the reported conversions of Dick or Schick-negative reactors to positive may have been due to the employment of syringes not beyond suspicion The fallacy may also be responsible for the view that has been expressed that children in tuberculosis sanatoria are more difficult to immunize against diphtheria than others The "positive Schick test" obtained after immunization may have been a positive tuberculin reaction due to the presence of traces of tuberculin in the hospital syringe It is not improbable, also, that some of the unusual reactions mentioned from time to time after the injection of vaccines, diphtheria prophylactic or hypodermic solutions or the abnormal larger reaction from the injection of "Schick-control" may be the result of syringes "contaminated" with tuberculin it is not generally realized that an apparently healthy person may give a vivid tuberculin reaction to a minute dose of tuberculin—for example, 0 1 c cm of a dilution of 1 in 50 000 or even 1 in 100,000 It may be wondered whether the method of sterilizing with weak soda, washing, and dry-heating described by J L Law and C W Cory[6] in the valuable number of tests carried out by them was sufficient to clear the previously used syringe of even these minute traces of tuberculin These problems must finally be solved by the combined efforts of laboratory worker and clinician

THE MEDICAL REGISTER UNTRACEABLE PRACTITIONERS

We publish in the *Supplement* this week, at the request of the General Medical Council a list of the names of those medical practitioners who have not replied to the Council's inquiries as to the accuracy of their postal addresses Any practitioner, wherever resident, whose name is included in this list should communicate at once with the Registrar of the General Medical Council, 44, Hallam Street, Portland Place, W 1, or, if originally registered in Scotland, with the Registrar of the Scottish Branch Council, 44, Queen Street, Edinburgh, 2

Sir StClair Thomson will give the annual address at the Central London Throat, Nose and Ear Hospital on Friday, October 8 at 4 p m His subject is "Subglottic Intrinsic Cancer of the Larynx"

ANAESTHESIA IN GENERAL PRACTICE

This is one of a series of articles, contributed by invitation

SPINAL ANAESTHESIA

BY

H K ASHWORTH, D A, M B, M R C S

Indications and Contraindications

With the qualification that few absolutely rigid rules can be made about the indications for any particular type of anaesthetic, those for spinal anaesthesia fall into four main groups

Group 1—Cases in which inhalational anaesthesia usually aggravates existing systemic disease—for example in patients suffering from diabetes phthisis bronchitis renal disease hyperpiesis, congestive cardiac lesions or obstructive jaundice

Group 2—Cases in which the performance of the operation is greatly facilitated by the unrivalled muscular relaxation provided by spinal anaesthesia—for example in intestinal obstruction lumbar sympathectomy, or abdominal operations in obese subjects Also in this group may be mentioned anaesthesia for evacuation of the uterus for inevitable abortion and for Caesarean section Spinal anaesthesia produces excellent uterine contractions thus diminishing haemorrhage and also ensures that the infant when born is not anaesthetized

Group 3—Cases in which the existing lesion gives rise to severe general toxaemia and in which good muscular relaxation is essential for adequate surgical treatment without the added toxin of ether or chloroform—for example in acute appendicitis with general peritonitis, and in cases of perforated gastric or duodenal ulcer

Group 4—The exigencies of practice—for example the single-handed emergency Spinal anaesthesia makes it possible for the single handed practitioner to undertake manipulations or other required treatment for dislocations or fractures of the leg It is also indicated for obstetrical emergencies Tropical climatic conditions and dread of unconsciousness are two obvious indications for the use of spinal anaesthesia.

The idea still unfortunately persists that the poorer the general condition of a patient the more is spinal anaesthesia to be preferred to inhalational anaesthesia Spinal anaesthesia is almost always the sure means of killing the moribund It should be a rule of sound practice that if the general condition of the patient cannot be improved by rest, warmth intravenous saline injections ephedrine, etc, until the systolic blood pressure has been raised to at least 90 mm and any pre-existing dehydration remedied then spinal anaesthesia should not be employed

Other contraindications are mental instability organic disease of the central nervous system, a septic lesion in the lumbar region deformity of the spine pyaemia and certain forms of severe cardiovascular disease profound anaemia low blood pressure or severe myocardial deficiency Children do not well tolerate spinal anaesthesia and unless there is an overwhelming indication this method is not to be recommended for patients under the age of at least 16 years

Premedication

Spinal anaesthesia should never be used unless the mental tranquillity of the patient is assured Patients between the ages of 16 and 60 should be given a subcutaneous injection of omnopon 1/3 grain and scopolamine 1/150 grain forty five minutes before the time of operation The dose of omnopon and scopolamine should be halved for patients over the age of 60 At the same time except in cases of hyperpiesis ephedrine 3/4 grain should be given by subcutaneous injection in order to combat the fall in blood pressure which often accompanies spinal anaesthesia Ephedrine is quite useless if, as popularly but erroneously employed, it is injected immediately before the administration of a spinal anaesthetic It is a slow acting drug and the vasoconstrictors are paralysed long before the ephedrine is absorbed from the subcutaneous tissues

Half an hour before operation the eyes and ears of the patient should be comfortably but effectively bandaged and he or she should be left in complete quiet This premedication is usually sufficient for the phlegmatic type of patient More highly strung or excitable patients should be given light inhalational anaesthesia during the operation

Technique

Ampoules of anaesthetic solution, files needles and syringes (employed solely for spinal and local anaesthesia) should be sterilized by prolonged soaking in spirit, and should be transferred to a bowl of sterile water at body temperature when required It is important that no trace of alkali should come into contact with the outfit at any stage of the proceedings, because the slightest trace is sufficient to precipitate and render ineffective both percaine and stovaine Fine bore needles with a narrow bevelled point and fitted stylet should be used These may be obtained to fit Record syringes and either this type or that with a simple bayonet catch of the Labat pattern is preferable to those to which the syringe has to be screwed Rigid aseptic precautions must be observed both in the sterilization of the administrator's hands and the patient's back and the administrator should always wear a sterile gown and gloves

Intrathecal puncture for spinal anaesthesia should always be performed in the second third or third fourth lumbar interspace and never at any higher level After the selected interspace has been palpated a skin wheal should be raised in the midline by the intradermal injection of a few drops of 1 or 2 per cent novocain solution and the skin and subcutaneous tissues pierced by a De Cnux primary puncture needle passed to a depth of about three quarters of an inch and immediately withdrawn The spinal needle is then passed through the track thus made and pushed on until the point is felt to have pierced the dura mater The stylet is then withdrawn, and clear cerebrospinal fluid should drip from the needle If by reason of difficulty in performing intrathecal puncture the cerebrospinal fluid is blood stained no attempt should be made to inject the anaesthetic solution until the drops become clear

Barker's solution of stovaine (specific gravity 1025) or the 1 in 200 solution of percaine (specific gravity 1026) are both considerably heavier than the cerebrospinal fluid (specific gravity 1004 to 1010) and either of these solutions may be used with the same technique of administration The chief differences between the two solutions are that the 1 in 200 solution of percaine takes slightly longer to produce anaesthesia, is given in a slightly larger dosage

and the resulting anaesthesia lasts much longer Upper abdominal anaesthesia with stovaine rarely lasts more than forty to fifty minutes, whereas heavy percaine is effective for twice as long Either solution can therefore be employed, the choice depending upon the probable duration of operation and the desirability or otherwise of a speedy recovery from the effects of the anaesthetic Height of anaesthesia with these two solutions is obtained by the process of gravitational diffusion, which consists of tilting the patient so that the nerve roots that supply the upper limit of the required anaesthesia are, as far as possible, made the most dependent part of the spine, then injecting the solution and leaving gravity to do the rest

Position of Patient During Administration

For subumbilical surgery anaesthesia should extend as high as the eighth dorsal nerve roots, and for full abdominal anaesthesia as high as the fifth dorsal The patient is placed on the table with the side on which the operation is to be performed downwards, unless the operation is bilateral, in which case it is immaterial on which side the patient lies For full abdominal anaesthesia the table is tilted into eight degrees of Trendelenburg position, and for subumbilical anaesthesia into five degrees At the same time the head and neck (but not the shoulders) of the patient are raised, either by lifting the headpiece of the operating table or else by a suitable arrangement of pillows This is done in order to prevent the solution from gravitating to a height at which it would anaesthetize the anterior roots of the phrenic nerves (third, fourth, and fifth cervical), thus causing paralysis of the diaphragm and almost instantaneous death A dose of 1 6 c cm of stovaine or 2 c cm of heavy percaine is usually adequate to obtain full abdominal anaesthesia

For operations on the leg 1.2 c cm of stovaine or 1 5 c cm of heavy percaine should be injected, but the table need not be tilted from the horizontal, although similar precautions should be observed for protecting the phrenic nerves by raising the head "Saddle area" anaesthesia is obtained by injecting 1 c cm of stovaine or 1 3 c cm of heavy percaine with the patient kept sitting upright for three minutes before lying down on a flat table with one pillow under the head This gives a localized but effective anaesthesia useful for the following procedures (1) obstetrical manœuvres, including forceps delivery, (2) vaginal and perineal operations, (3) haemorrhoidectomy, (4) operation for fistula in ano, ischio-rectal abscess, etc When stovaine or heavy percaine have been used the Trendelenburg position cannot safely be adopted until at least fifteen minutes have elapsed for fear of upward spread of the solution towards the phrenic nerve roots

The Use of Light Percaine

For operations necessitating the rapid adoption of the Trendelenburg position, or performed in the lateral posture, as, for example, in thoracic or renal operations and for quiet (but not for urgent) upper abdominal surgery of prolonged duration the original 1 in 1,500 solution of light percaine (specific gravity 100345) in 0 5 per cent saline is still pre-eminent The use of this solution necessitates an entirely different technique which was originally described by the late Howard-Jones The cardinal feature of this procedure is that a slight degree of Trendelenburg position is essential immediately following the administration of the anaesthetic and for three hours subsequently

The dose should be varied according to the size and bulk of the patient within the limits tabulated

	Males	Females
For subumbilical surgery	11–13 c.cm.	10–12 c.cm
For full abdominal anaesthesia renal or thoracic surgery	13 5–16 c cm	12.5–15 c.cm

A 20 c cm syringe is charged with 2 c cm of the solution and the plunger pulled up and down in order to rinse the syringe with the solution The 2 c cm is then ejected and the syringe filled with the requisite dose of percaine The patient is placed in the lateral flexed posture on a horizontal table without a pillow and with the side on which the operation is to be performed uppermost Intrathecal puncture is performed as previously described and the requisite dose of light percaine evenly and gently injected, the actual injection occupying twenty-five to thirty five seconds After the needle has been withdrawn the table is slightly tilted until the head of the patient is just dependent The patient is then gently turned over to assume the ventral decubitus for six to ten minutes in order that the light percaine solution may soak the posterior nerve roots After six to ten minutes the patient is turned on to his back and the operation may be started immediately If the operation is one which necessitates the lateral posture no alteration (other than slight tilting of the table) is made in the position of the patient after the injection of the light percaine, and the operation may be begun after six to ten minutes have elapsed for the development of anaesthesia

During operations performed under light percaine anaesthesia the patient may be immediately placed in any degree of Trendelenburg position surgically desirable As previously mentioned, a slight degree of Trendelenburg position must be maintained for three hours following administration, which necessitates the raising of the foot of the patient s bed on blocks irrespective of the surgical desirability of this procedure For this reason light percaine is not the anaesthetic of choice for emergency abdominal surgery in the presence of peritonitis, ascites, etc Light percaine produces anaesthesia in the upper abdomen lasting for a minimum of one and a half and usually for two to two and a half hours

Management of the Patient

The first important point is to ascertain that the spinal anaesthetic is working well No attempt should be made to test the efficiency of the anaesthetic upon any site which is not expected to be fully anaesthetized, or before sufficient time has passed after injection for anaesthesia to develop If a patient is once hurt his confidence is destroyed and is seldom completely restored In testing anaesthesia a sharp pointed towel-clip is the most satisfactory instrument to employ The patient should never be asked if he can feel anything or be allowed to see any test being performed, but the anaesthetist must watch the patient s face carefuly Imperfect anaesthesia will be demonstrated by a contraction of the mouth The patient should be asked to raise the legs, and also to take a deep breath, then give a cough, while the anaesthetist watches the abdomen Bulging of the abdomen when the patient coughs indicates that the anaesthetic has produced relaxation of the abdominal muscles The patient s arms should be placed by the side and comfortably but firmly fixed by a sheet or other suitable device to the table The hands should never be placed under the buttocks during operations under spinal anaesthesia

Whether supplementary light inhalational anaesthesia should be given should be decided on the merits of each particular case Generally it is necessary during upper abdominal surgery, otherwise traction on the upper abdominal viscera or manipulations in the region of the diaphragm cause discomfort nausea or vomiting, and a consequent reflex fall in blood pressure Gas and oxygen is ideal but if this is not available a satisfactory light and harmless anaesthesia of the midwifery type may be obtained by the use of a few drops of chloroform and ether mixture on an open mask Inhalational anaesthesia is rarely necessary for procedures other than upper abdominal surgery except in the case of nervous patients upon whom the preliminary dose of omnopon and scopolamine has not produced its usual tranquillizing effect

It is the duty of the anaesthetist to protect the patient from being treated to any undesirable dissertation on the state of his or her inside by a forgetful surgeon Omnopon and scopolamine alone often confer complete amnesia but it is generally in the wrong case that it fails to do so If consultations are desirable among those present as to further procedure after the lesion has been exposed, it is usually expedient to administer light inhalational anaesthesia Similarly the anaesthetist should ensure that the unanaesthetized chest of the patient is not used as a repository for temporarily unwanted instruments

Management of the Common Complications

A fall in the blood pressure is a normal physiological accompaniment of all high spinal anaesthesia and only calls for restorative measures when profound in degree In the latter cases the Trendelenburg position should be adopted and the patient should inhale sal volatile Drug treatment consists in the subcutaneous injection of pituitrin 1 c.cm or, in really alarming cases, in the intravenous injection of 2 or 3 minims of an ampoule of 1 in 1 000 solution of adrenaline In this connexion the use of a bridge on the operating table almost invariably causes an undue fall in the blood pressure of a patient under spinal anaesthesia The anaesthetist should politely but firmly deprecate the use of a bridge for operations on the biliary passages unless it is absolutely essential In the majority of cases the perfect muscular relaxation and comparative stillness of the abdominal contents produced by spinal anaesthesia appear to compensate the surgeon for the loss of one of his aids This does not apply to operations on the kidney performed in the lateral posture In these the use of the bridge has not usually the same obstructive effect on the venous circulation

Unless there is any surgical contraindication—for example pelvic peritonitis—and despite any surgical contraindication if the general condition is poor the foot of the bed should always be raised on blocks for at least three hours after the administration of a spinal anaesthetic irrespective of the drug used Subsequently one pillow should be added beneath the head every hour until the patient has been raised to the degree desirable for nursing In cases of peritonitis etc., in which the general condition is fair or good and in which any drug except light pericaine has been used the blocks should be omitted The patient should be flat with a small pillow under the head for three hours and should then be gradually raised in the manner described

A French society for the study of cardiology has recently been organized by Dr Laubry and other heart specialists in co-operation with the editorial board of the *Archives des Maladies du Coeur*

INTERNATIONAL HYGIENE

[From a Correspondent at Geneva]

The fires of oratory at the present Assembly of the League do not burn brightly Whether it is due to the world situation or to the overwhelming effect of the new palace at Ariana Park—rather like an oriental dream—the tribune is unoccupied Appeals by the president of the Assembly (the Aga Khan) for orators to inscribe their names go unregarded A single speech and a morning session is at an end The commissions also fail to arouse debating enthusiasm A discussion on the status of women lapsed within an hour Even the League's budget goes through almost in silence The only occasion on which there has been any competition in oratory, the debate extending over two sessions was when the report of the Health Organization came forward for review, and this subject aroused no controversy, only a desire on the part of every delegate to show how progressive was his own country in health matters

A New Covenant and a New Habitation?

As health seems to be the one subject on which all nations are agreed it might be a wise expedient to divorce the Health Section and perhaps the sections dealing with social questions and the drug traffic from the unstable and weakening political framework of the League, and construct for them a new Covenant and give them a new habitation Such a non-political League would command the adhesion of all nations including those at present outside the membership—namely, the United States, Germany, and Japan—as well as indifferent members such as Italy As there is great sensitiveness with regard to localities the centre of such a League ought not to be at Geneva perhaps it might be located in a country like Palestine at the junction of three continents or in Egypt, the youngest member of the present League, whose delegate Dr El Wakil, professor of the Faculty of Medicine at Cairo declared in the course of the debate that the science of medicine, both preventive and curative, was born and systematized in the land of the Pharaohs and for centuries practised and taught there before it was practised and taught anywhere else

In the debate on health questions the Chinese delegate described how the authorities in his country with the aid of the League were stamping out epidemics of cholera in the Shanghai and Canton areas The Finnish delegate spoke at length of the way in which Government authorities and voluntary bodies in Finland were coping with the problem of tuberculosis and he urged the Health Organization to set up a special committee to deal with that subject The League he said had concentrated rather upon tropical diseases and had not done much work on diseases which by reason of their incidence their chronic nature and their social consequences commanded public attention in Europe The Indian delegate mentioned some recent achievements in his country in the sphere of public health including the establishment of a committee for the standardization of therapeutic substances and the inauguration of new anti-malarial measures The Central and South American delegates all acclaimed the projected conference on rural hygiene which is to be held in Mexico City in December 1938 and for which fourteen American countries including Canada and the United States, have already accepted invitations

Hygiene in the Far East

The report of the conference of Far Eastern countries on rural hygiene held at Bandoeng, Java in August was placed before the Assembly Its president was Dr J Offringa director of the Netherlands Indian Public Medical Service, and its secretary Dr L Rajchman director of the League Health Section and fourteen countries were represented whose populations aggregated to more than half the total population of the world One of

the subjects discussed was the collection of accurate vital statistics Many countries in the East have not yet brought together the statistical data to afford accurate information on mortality and morbidity, yet the development of a sound public health programme must necessarily rest on the basis of exact information Discussions took place on the importance of the decentralization of health and medical services It was felt that the greatest benefit to the health of rural populations, at the smallest cost, could be obtained through some decentralizing process, but emphasis was also laid on the importance of proper control from the central authority and the adequate protection of the personnel as to their tenure of office

The significance of malaria in Eastern countries was stressed by the conference An appalling mortality is at the present time caused by malaria in many countries of the East It was stated that a great majority of the victims could be saved apart from epidemic outbreaks if it were possible to supply them with a few doses of quinine in time Furthermore this treatment would in many cases suffice to enable the patients to resume their normal life and work, so that the economic havoc caused by the disease would be materially lessened It was the general opinion that the Governments should take the responsibility of supplying treatment to the malarious sick, and of giving such treatment not only in times of epidemics but also under ordinary conditions Totaquina and cinchona febrifuge were declared to be satisfactory for this purpose of saving life and reducing distress, and furthermore, had the advantage of being cheaper than quinine

Other health measures advocated by the conference concerned tuberculosis pneumonia, leprosy, and plague The importance of carrying out preliminary surveys and sample tuberculin tests was recognized, but the financial limitations of Eastern countries make it important that an anti-tuberculosis programme should be simple and adapted to local conditions The problem of pneumonia remains a serious one in the East, and only recently has very much attention been paid to it It was suggested that a plan of campaign should be entrusted to a body of experts familiar with tropical conditions With regard to leprosy, the conference felt that while many lacunae existed in the knowledge of this disease, methods found applicable in its control in many countries should be used wherever possible On plague the conference referred to the Advisory Council of the League of Nations Eastern Bureau two proposals one concerning the control of land and rail traffic so as to prevent the spread of infection, and the other an exchange between Governments of information and the best designs for rat-proofing rural houses and cottages On the more general question of training it was pointed out that the lack of properly trained people is retarding development in all directions There must "be no compromise in the training of the qualified men and women in medicine, and every country should maintain the highest standards commensurate with its resources and level of general education '

The Health Budget

The budget of the International Health Organization for 1938 provides for an expenditure of one million Swiss francs (about £48,000), of which 50,000 francs are to be spent on international biological standardization and 30,000 on liaison between the various national health services collective and individual missions, and special technical studies Hitherto the vote for the International Health Organization has included a grant of 300,000 francs from the Rockefeller Foundation this is no longer forthcoming but the League funds have made up the difference, and the estimate for 1938 is virtually the same as the expenditure for 1937

A new journal on circulatory disorders, the *Archives of Research on the Circulation* has been published by Theodor Steinkopff of Dresden and is edited by Professor Dr Eb Koch (Bad Nauheim) and Professor Dr Fd Stadler (Plauen-i-V)

CONGRESS OF MASSAGE AND MEDICAL GYMNASTICS

While the number of attendances at the 1937 annual congress of the Chartered Society of Massage and Medical Gymnastics approximated those of previous years there was a noticeable increase of attention paid to the most modern methods and doctrines, as well as a greater diversity of subjects for discussion Lantern and cinematograph lectures were a prominent feature of the meetings at the London School of Economics from September 20 to 24 inclusive Practical demonstrations on new suspension exercises for the head and trunk, the Goldthwait postural exercises, crawling exercises, and the application of hot mud packs to various parts of the body proved very popular, while in the brief afternoon intervals members visited with great interest the British Red Cross Society's clinic for rheumatism, the rheumatic clinic on Clapham Common of the L G O C Employees' Friendly Society, St Vincent's Orthopaedic Hospital at Pinner the physiotherapeutic department at St Thomas's Hospital and Queen Mary's Hospital for Children at Carshalton The lectures ranged from the most technical topics to such subjects of more general interest as the development of the movement to improve the fitness of the nation Sir Kaye Le Fleming, who presided at this one, stressed the importance of providing wise and skilled guidance for the intensifying campaign, and his warnings were reiterated in the discussion which followed the lecture on this subject by Miss E R Clarke Mrs Guthrie Smith suggested that steps ought to be taken to ensure that all voluntary trainees were medically graded and carefully supervised according to their physical condition if harm rather than good was not to ensue

Too Narrow a Title

The enlarging scope of the Chartered Society was instanced again by a debate which followed the annual meeting in the course of which it was pointed out clearly that the activities of members included various modern forms of physiotherapeutic assistance under the supervision of medical practitioners, and that such electrical and other work was not indicated by the present rather misleading title by which the society was at present known Great difficulty was experienced, however in deciding on a title which would be adequate as well as reasonably brief so widely has the Chartered Society expanded since its start as an examining board in 1894, and its inauguration as an incorporated society six years later Two of the original founders were present at the annual dinner and one at the special Founders Lecture, with which Mr H A T Fairbank on the last evening brought an outstandingly successful and scientific congress to a triumphant close As one illustration of its modern outlook may be cited the brilliant lantern and cinematographic demonstration by Mr E R Desoutter on the triumphs now achieved in the manufacture of artificial limbs The scientific proceedings of the congress will be published this autumn in a special issue (price 2s 6d) of the society's *Journal* The subjects discussed include the treatment of scoliosis, intracapsular fractures, chronic backache, and rheumatism, indications for short-wave therapy, orthopaedic operations under spinal anaesthesia, psychological factors in physical disease, the surgery of the sympathetic nervous system, and faradism and pelvic floor exercises for urinary incontinence Many medical practitioners attended these demonstrations as guests of the Chartered Society

The Annual Dinner

Proposing the toast of the Society at the annual dinner, held on September 22 at the Café Royal, Mr H A T Fairbank traced the growth of the organization to its present membership of over 11,000, and empha-

sized its insistence on the highest possible ethical and professional standard He pleaded for still more research, particularly in electrical and cognate methods of therapeutics, and commented on the value of the Society's strict loyalty to and co operation with the medical profession Miss Pratt added that a research scholarship dealing with the physiology of the body was about to be instituted, while Miss Wicksteed, proposing the health of the guests, commented on the increasing ability of the medical profession to give detailed and scientific instruction as regards physical treatment Sir William Willcox mentioned the co operation of the society with the British Medical Association in the compilation of the *National Register of Medical Auxiliaries* Dr F A Roper added that the members of the Society were its most effective missionaries, and that their work boded well for still greater success and usefulness in the future The pioneer work and untiring devotion to the Society of its chairman of council Dr J B Mennell, were enthusiastically acknowledged by Dr W J O Donovan

Nova et Vetera

A LETTER BY EDWARD JENNER

The following letter, in the handwriting of Edward Jenner not previously published, has been found in an old scrap book belonging to Frank Buckland The lady to whom it was addressed was the second wife of our correspondent's grandfather, Mr B Morland (born 1788 died 1833) who practised as a solicitor at Abingdon Jenner wrote this letter six years after the introduction of vaccination in 1798 and it is of interest as it shows how widely vaccination had been adopted at that time and also because of the care that he took to prevent error and false alarms

Berkeley Glos
March 4th 1804

Madam

Having some time since heard that a report was current in Town that a child of a Mr Grant at Portsmouth had received the smallpox after it had been inoculated *by me* for the cowpox I *requested a friend in Town* (Mr King Surgeon in New St Hanover Square) to make an inquiry into the business Mr King immediately wrote to Mr Grant who explained the matter in a very candid and satisfactory manner It turned out to be nothing more than one of those rashes which an irritable skin is very apt to push out on the application of acrid substances particularly the animal poisons Seeing that such cases must necessarily occur I did not omit to guard the World against false alarms in my earliest publications on the vaccine subject but unfortunately without a reference to these or anything of the kind without a knowledge of the Vaccine Disease or the smallpox entirely ignorant too of the laws of the animal œconomy prejudiced persons like Mr Seaton, dash into the subject reason and decide at once One would suppose from reading this gentleman's letter that vaccination was a project of a month old Could anyone imagine that at the time Mr S penned it millions of persons having been inoculated for the cowpox had been exposed to the infection of the smallpox without feeling any ill consequence? Had the child of Mr Grant been exposed to the effluvia of smallpox no ill consequence would have ensued In a word the experience of the world (for all civilised nations have now adopted vaccine inoculation) allows me to say that no one who has passed through the vaccine disease correctly ever caught the smallpox after the most rigid exposure to it even in its most active and malignant forms

I have the Honour to be Madam
your very faithful
humble servt.
E. JENNER

P.S. If I recollect right I had an interview with Mr Morland at Benson in my way from Town on the subject of the Inoculation of your Infant

THE MEDICAL SITUATION IN SHANGHAI

EFFECTS OF AIR BOMBARDMENT

The following letter with enclosures has been received at the Headquarters of the British Medical Association

c/o Public Health Department S M C,
Shanghai August 30, 1937

The Secretary
British Medical Association
Tavistock Square London

Sir,

On the evening of Saturday August 28 through the courtesy of the Central News Agency, the following radiogram was sent to you

Shanghai British doctors handling Chinese casualties appealing B M A use any political influence prevent inhuman carnage caused Chinese women children, by Japanese bombing

In confirmation of this message we are desirous of explaining briefly the conditions under which it was sent The medical situation in Shanghai has been one of extreme difficulty throughout this emergency period owing to occupation of a part of the International Settlement by Japanese forces and the danger (subsequently made all too real) of hostilities in that area Several hospitals, general and isolation, had to be evacuated This thrust a severe enough burden on the few remaining hospitals of the International Settlement and French Concession dealing with sick and wounded Chinese civilians To this was added the large number of injured in the accidental bombing of August 14 and 23, and it should be noted that such hospitals have had to act at once as first aid stations casualty clearing stations, base hospitals and, until yesterday, convalescent hospitals there being no further place to which to evacuate their patients

The Lester Chinese Hospital, a 93 year old British institution run entirely for Chinese civilians and staffed by British and Chinese doctors, nurses, and technical staff is one of the most centrally situated and has acted as one of the chief centres for casualty work With its five operating theatres working often at full pressure and its wards crowded with extra beds, many patients having at times to be accommodated on the floor it has presented a very realistic picture of the results of modern warfare (declared or undeclared) around and over a densely populated city On August 28 a number of Japanese planes were clearly visible hovering over the region of the Shanghai South Station a district outside the Settlement but within the limits of the Chinese city area

It has been abundantly proved that not only were there no troops or troop movements anywhere near the place but control was entirely in the hands of a small number of police The station and its precincts were however, crowded with Chinese refugees awaiting trains to take them from this severely congested area After full observation the deliberate multiple bombing of these defenceless people ensued and a short time later the mangled remains started to pour into the hospitals

Standing in the courtyard of one of these hospitals seeing the lorries ambulances rickshaws and private cars pouring in and depositing their loads of broken maimed and often dying people or working in the out patient and casualty departments or in the various operating theatres the sight of women and children deliberately butchered by the bombers could not but force us to urge on our home people to rise and crush such utter inhumanity Nearly 200 killed outright and over 400 wounded mainly *women and little children such is the record of those few* moments on Saturday last and it is with the vision all too clear in our minds of an area strewn with the broken fragments of these women and children of hospital courtyards and rooms red with seeping blood of rows of the maimed hovering between life and death of

parentless children and childless mothers, that we send this appeal If anything is needed to complete this picture it can be added in the sight of crowds of anxious relatives rushing from hospital to hospital, seeking their dear ones, and too often finding only their dead

I may add that in my official position—attached to the Shanghai Municipal Council s Health Department, where I have been engaged in organizing the medical inspection of refugee camps, over 100 in number, with a population of 70 000 refugees—I have personally experienced all this slaughter of non-combatants many of the slighter cases of wounding having come back to refugee camps I enclose a number of photographs which speak for themselves I also enclose leaders in two of our prominent English newspapers which present an accurate critical résumé of the situation

I have the honour to be,

Your obedient servant,

R C Robertson
M C M D Glasg M R C P Ed
D P H Ed F R F P & S Glasg
Head of Division of Pathological Sciences Henry Lester Institute of Medical Research temporarily attached to the Public Health Department, S M C

Local News

IRELAND

Decrease in Zymotic Diseases

The report for 1935–6 of the Department of Local Government and Public Health, Irish Free State, records a slight rise in the general death rate , increases are shown in the majority of classified causes of death with whooping cough and typhoid as exceptions With regard to zymotic diseases the incidence of typhus fever was the lowest ever recorded in the Free State , only three cases occurred, while in the previous year there were seventeen When it is recalled that exactly a hundred years ago in 1847, the number of typhus cases in Dublin alone exceeded 40,000 and in the whole of Ireland reached more than a million, the present figures may be regarded as the happy result of a long struggle to improve insanitary conditions and to reduce overcrowding and poverty During the last two years especially efforts have been made towards better housing conditions in typhus endemic areas, and arrangements for the provision of free milk and meat have been in force The three cases, which occurred in counties Waterford and Cork, were sporadic, and in no way connected with one another The report points out that the presence of lice on the bodies of ill-nourished children and adults is far from uncommon, even though personal cleanliness may be beyond question Therefore it is imperative, in dealing with the problem of typhus fever, to take adequate measures for the improvement of the nutrition of the poor The number of cases of typhoid reported during the year was 420 This figure, though high, compares very favourably with the 590 of the previous year Deaths from typhoid numbered sixty-four, the lowest ever recorded in the Free State A table demonstrates the effect of improved sanitary conditions on the incidence of typhoid In Cork county borough a rapid gravity filtration plant in connexion with the water supply was installed in 1928 in the same year the practice of systematic bacteriological examination of the water was instituted For the three decennial periods from 1895 to 1924 the number of cases of typhoid was 613 503, and 460 respectively , for the decade 1925 to 1934, a period including several years subsequent to the installation of the new plant, the figure fell to seventy-six. The number of deaths decreased proportionately It is stated that the city was entirely free from the disease in 1930, and in each of the four cases, constituting the total incidence during the three following years, the source of infection was outside the city In 1935, however, three cases were notified Returning to the year under review the report states that no serious epidemic of typhoid occurred in the Free State, though there were a number of small local outbreaks One of these occurred in a public institution within Limerick county borough There were eighteen cases, including one each of paratyphoid A and B, and infection was traced to two carriers, who were isolated A carrier was also responsible for seventeen cases in Dingle rural district A small outbreak in a mental hospital in Galway proved to be due to contamination of a well Although questions of domestic sanitation, water supply, and milk supply play a large part in the control of typhoid, the report stresses the paramount importance of carriers "Every outbreak of typhoid leaves its trail of carriers behind' It is therefore essential to concentrate on the provision of efficient machinery for the detection, treatment and control of carriers in the area of every health officer As in preceding years, a complete absence of small pox is recorded Efficient protective measures have kept the Free State immune from this disease for more than a decade. The report points out however that in some districts the local sanitary authorities fail to enforce the Vaccination Acts 'Once the barrier is broken and one case of small pox occurs in this country the result may very well be disastrous in a population a large proportion of which is unvaccinated ' An interesting feature of the report consists of appendices detailing the application of proceeds of the sweepstakes

Tuberculosis in Belfast

The annual report (1936) of the tuberculosis department of the city and county borough of Belfast states that the total number of patients observed or treated during the year was 7,445 A table dealing with the mode of infection shows that out of 1,109 new cases examined during the year 466, or 42 per cent , had been in contact with other tuberculous patients Although the remaining 643 cases gave no history of contact, it may have taken place without their knowledge in a considerable number of instances This assumption was proved to be true by the extensive use of the purified protein derivative (P P D) test, 1,549 of these tests being made during the year The intradermal method has been employed, with 0 1 c cm doses of varying strengths of P P D (as issued in tablet form by Parke, Davis and Co) The report stresses the value of this test in diagnosis, and its superiority over old tuberculin in its freedom from the undesirable secondary effects caused by the latter s lipoid and carbohydrate fractions and the consequent avoidance in large measure, of headache, malaise, and febrile manifestations

Down Mental Hospital, Downpatrick

Voluntary admissions to Down Mental Hospital, Downpatrick, continue to show an increase Voluntary patients, however, create a problem, states the medical superintendent in his annual report, by their tendency to ask to return home as soon as a decided improvement in their condition becomes perceptible, but before recovery can be considered complete The importunities of the patients relatives do not facilitate the solution of this problem Syphilis was a factor in seven cases admitted during the year , four of these being general paralysis of the insane In one case the patient, suffering from juvenile G P I , was a girl who had so far deteriorated from normality that she disregarded the calls of nature and employed her time tearing up her clothes and every article on which she could lay her hands Treatment with tryparsamide and bismuth effected so remarkable an improvement in her that she was able to return home Other cases due

to syphilis were those in which the disease had caused degeneration of the blood vessels and membranes of the brain in one infection had occurred forty years previously Among other causes of mental symptoms were pernicious anaemia and encephalitis lethargica and the report points out that the former should be preventable Some of the sufferers however had lived alone in remote districts and their condition was not realized until the onset of the mental symptoms One case of confusional insanity was found to be due to poteen drinking Although this patient recovered the report stresses the importance of warning the public against indulgence in crude spirits leading to permanent dementia

ENGLAND AND WALES

The Harrogate Spa Development Scheme

On October 6 Sir Kingsley Wood the Minister of Health will lay the foundation stone of the new extensions to the Harrogate Royal Baths These extensions have been under consideration by the Corporation for several years and no effort has been spared in the design and equipment of the new building Two years ago a select committee of officials and members of the Harrogate Corporation made an intensive study of the English and several of the Continental spas visiting many places both at home and abroad and the knowledge gained has been of great service in the planning and designing of the present scheme The new block of buildings will incorporate the most recent developments and modern devices in balneological treatment The extensions include (1) the provision of an entirely new block of buildings adjoining and connecting the present baths, (2) reconstruction of the Winter Gardens (3) general refitting of the existing bathing establishment at the Royal Baths When this spa development scheme is completed, which will take about two and a half years at an estimated cost of £66 000 Harrogate can rightly claim to be one of the best equipped spas in Europe

Remedies for Nursing Shortage

Sir Kingsley Wood, opening the new health centre at South Shields last week, made pointed reference to the need for maintaining an adequate and efficient nursing service throughout the country It was he said a matter that concerned not only the institutions of the local authorities and the voluntary hospitals but also the sick in their own homes The number of nurses entering the profession had not in fact fallen but the great expansion of the hospital and allied services was to-day demanding more entrants and that demand might well be further increased in the future There were other considerable problems like the conditions of the service itself recruitment and methods of training Girls for instance in secondary schools who had an inclination to take up the profession were not able at present to begin their studies or to take part of their professional examination before entering hospital at the age of 18 There was also the need for securing the best possible working conditions for hospital nurses both during their training and afterwards He was glad to observe that the movement for shorter hours and other improvements was gathering force A number of authorities and institutions had already done much in this connexion and the adoption of shorter hours was one of the factors contributing to the shortage of nurses since more nurses were required for a given number of patients A matter of pre-eminent importance was accommodation for nurses It was a step in the right direction that in the last two years the Ministry of Health had sanctioned loans to local authorities amounting to [illegible] for the provision of additional nurses' accommodation and improvements and during the same period nearly £200 000 derived from other sources was spent by the authorities for the same purpose Voluntary hospitals were moving in the same direction He believed ways could be found by which all these matters could be further substantially advanced The President of the Board of Education had not only a keen personal interest in the matter but had a close connexion with the question of recruitment and training The President and himself had therefore decided to appoint at an early date a committee including representatives of the hospitals, the local authorities and the medical and nursing professions to make a comprehensive inquiry into the whole subject of the recruitment and training of nurses for the sick The inquiry must cover the whole field including conditions of service

Rebuilding St. George's Hospital

A donation of £80,000 has been given by Mr Harry Oakes to the treasurers of St George's Hospital This munificent gift the largest single amount yet subscribed to the rebuilding fund has been made in order to enable building operations to begin next year The site of the new St George's Hospital includes all the old Knightsbridge houses as far as the former underground station The hospital owns half the estate the freehold of the other half was acquired at a very low figure from the Duke of Westminster in 1906 There is however a right of pre-emption under which that half of the property would revert to the Westminster Estate in the event of the hospital moving to another site In spite of many statements to the contrary no satisfactory offer for the property has ever materialized A special committee was appointed to investigate the possibility of moving to another site, many sites were inspected, but not one could be found at a price the hospital could afford to pay—nor indeed was one found suitable for the re-erection of the hospital The new building will contain 520 beds instead of the present 330 including a block of 50 private beds for persons of limited means

SCOTLAND

Rheumatic Clinic at Aberdeen

At a meeting of Aberdeen town council on September 19 Lord Provost Edward W Watt presiding it was agreed to consider the establishment of a clinic for the treatment of industrial rheumatism and to proceed at once with part of the scheme The matter arose out of a report by Dr Harry J Rae medical officer of health for the city of Aberdeen who after pointing out that rheumatic diseases were of the greatest importance in connexion with the working capacity of the community suggested that facilities should be provided for their diagnosis and early treatment It was stated that Aberdeen was the only local authority in Scotland which had yet proposed to deal in a systematic way with cases of rheumatism The scheme involves the establishment of a clinic and the installation of deep immersion baths with sprays and of peat and mud baths The council resolved to get estimates for the expenditure that would be incurred

Health of Dundee

The report for 1936 of the public health department of the city of Dundee records a slight increase in the general death rate The infantile mortality rate of 81 per 1000 births although a little less than that for the whole of Scotland and considerably less than that for the large burghs combined compares unfavourably with the record figure of 68 for the previous year This is attributed to an outbreak of primary pneumonia in January and February Of the 681 notifications 427 were of children under 5 years including 191 under 1 year The disease

caused sixty eight infant deaths compared with thirty-five in 1935 The incidence of dysentery in the city rose from sixteen cases in 1935 to eighty four in 1936 In forty-nine of these the diagnosis of bacillary dysentery was accepted The majority of the cases were of a mild type, and only three patients were given serum The greatest number of cases occurred in the periods April-May and September-October With the exception of one family, from which three children were admitted to hospital, no large family outbreaks were recorded Most of the cases were in children, those under 5 years accounting for 60 per cent of the total figure Of the three deaths in King s Cross Hospital concurrent infection was a contributory cause in each case

Cost of Milk

In his report for 1936 Dr A Johnstone, medical officer of health for Greenock, devotes particular attention to the question of nutrition and physical fitness Discussing the problem of increased consumption of milk he points out that milk at the present time is too expensive for the family of a low-wage earner consisting of father, expectant mother and six children, who would require about eight pints daily, costing approximately fourteen shillings per week If milk is to become the key of the population s nutrition, the report continues some means must be found materially to reduce the cost The local authority had realized the value of milk for many years, and had provided free milk under its maternity and child welfare scheme The Health Department had, however, worked in the face of persistent prejudice and ignorance, for it had been found that in households where milk was provided for an expectant mother or a child it had been used simply as a general supplement to the family income instead of being devoted to the purpose for which it was given

Correspondence

Quinine Tolerance and Hyperthyroidism

SIR —I was interested in Dr Piney s letter in your issue of September 25 (p 637), for I have long been impressed with the beneficial effects of quinine in the form of the hydrobromide in hyperthyroidism, as was originally recommended by Sir Robert McCarrison With regard to the suggestion that determination of quinine tolerance might be of diagnostic value, Bram in 1921, and again more specifically in 1928 (*Arch Int Med* July, **53**) urged this method He maintained that if a patient could take 10 grains of quinine hydrobromide four-hourly for forty-eight hours without developing symptoms of cinchonism hyperthyroidism was present

That persons with hypothyroidism should be sensitive to quinine would seem to follow logically, but I think Dr Piney is the first to call attention to it —I am, etc ,

London, W 1, Sept 27 W Langdon-Brown

Indications for Induction of Abortion

SIR —In his letter (September 25, p 635) Mr E A Butterworth mentions two cases in which he believes that abortion should have been induced While protesting against the contrary view of the colleagues to whom he referred these cases he frankly admits that on purely clinical grounds they were justified in their refusal to induce abortion but he regrets that they did not allow what he euphemistically calls "the personal aspect of the cases to outweigh the absence of clinical indications for the treatment he proposed For some of us the heavy responsibilities inherent in the practice of medicine are sufficient, and we are unwilling to assume others that are not within our proper terms of reference or within our special competence to assume *Ne sutor ultra crepidam* is an old tag not without influence with us

But Mr Butterworth thinks we should be ready to advocate or to induce abortion in the case of any pregnant woman who is likely to find childbirth or the care of a child a strain, and prepared to prevent from being born alive any child whose future home conditions are, in our inspired view, unlikely to be favourable to its upbringing His position has only to be thus bluntly stated for its wholly untenable character to be apparent If the procedure he indicates were adopted it would open the door for any amateur sociologist or any sentimentalist who chanced to be on the *Medical Register* to induce abortion where no medical indications might obtain

As a profession we may not always find the Law the most enlightened of institutions, but we may be thankful that *in this country it will never hand over to us the* power of life and death over our future fellow-citizens that Mr Butterworth—surely unthinkingly—desires Nor is it likely that a nation still given to occasional easy boasting that it has cast off the shackles of a mediaeval ecclesiastical tyranny will knowingly fetter itself with the chains of a potential medical tyranny that would be far worse in that it lacked fixed or rational principles and was guided by no more impressive philosophy than an untutored opportunism —I am, etc ,

London W 1, Sept 24 F M R Walshe

Endotracheal Anaesthesia

SIR —I read with interest the article by Dr Ivor Lewis on endotracheal anaesthesia in your issue of September 25 With most of the paper I cordially agree, but I would like to make some observations on a few of the categorical statements he makes therein I have had a continuous experience of endotracheal anaesthesia for the past twenty-five years, and have employed it in many thousands of cases of all kinds since I first introduced the method into England in 1912 It is not only the best and safest method of administering ether but it is in addition a means of artificial respiration

But I have noticed in the last five or six years that professional anaesthetists all over the country are getting further and further away from the rigid principles laid down by Meltzer and Auer in 1909 Their needlessly cumbersome instruments and methods show that these principles are in danger of being forgotten Those two great physiologists showed that in a curarized animal in which the movements of respiration were entirely suspended life could be maintained by a continuous stream of air in *one* direction—that is, in by an endotracheal catheter and out through the glottis The catheter in the trachea should have a lumen of about half the diameter of the trachea, it must reach down to the bifurcation—the pressure of air should be 10 to 12 mm of mercury, and the cross-section of the whole catheter must occupy about two thirds of the open area of the glottis

If all these conditions are present a curarized dog can be kept alive for many hours Similarly dogs poisoned by a lethal dose of strychnine, morphine, carbon monoxide gas, or ether pushed to cardiac failure could all be resuscitated Should however, the tube be too large or too small or not reach to the bifurcation of the trachea or if it be inserted through a tracheotomy opening instead of the natural glottis, the curarized animal would surely die

However if the pressure of air were released occasionally and the lungs allowed to collapse a few times every minute thin slight variations in the size or length of the endotracheal tube would not be so important In other words the curarized animal lived even if the tube were not of the correct size providing attempts were made mechanically to imitate the movements of respiration and so allow the heart and great veins to fill with blood

In endotracheal anaesthesia in human beings the movements of respiration are never entirely suspended It follows therefore that the method *may* be successful with all sizes and lengths of tubing but the fact remains that the optimum size and length has been departed from with consequent physiological deterioration of its artificial respiratory mechanism

It will be obvious from what I have just written that I object strongly to the sentence in Dr Lewis's second paragraph 'The method of insufflation in which the anaesthetic vapour is blown through a small bore catheter and returns around a tube is now almost effete It is not effete On the contrary, it is founded on the basic principles of the method and any departure from this impairs its great value In my opinion it is wrong to use large tubes which fill the glottis It is unnecessary to use bags, it is wrong to allow rebreathing of any kind It is wrong to pack the mouth with gauze to use a stomach tube or a second pharyngeal tube With an efficient apparatus water saliva, pus blood or stomach contents may be poured into the mouth without any of these foreign substances entering the trachea With a direct laryngoscope a small bore catheter may be passed by direct vision safely surely and aseptically Why use the nasal route which has none of these advantages?

Finally I object to Dr Lewis's sentence, 'absolute contraindications include thyroid operations I do not know how many thyroidectomies I have done in the last twenty five years but the number must be well over five hundred I have used nothing else but endotracheal anaesthesia in these cases and I have never had the slightest difficulty in passing the tube Post anaesthetic tracheitis or lung complications have been immeasurably fewer than by any other method of anaesthesia local or general—I am etc,

Liverpool Sept 27 R E KELLY

SIR—It is unfortunate that Dr Ivor Lewis in his otherwise interesting article in the series on Anaesthesia in General Practice should have made the assertion that intratracheal anaesthesia is absolutely contraindicated in thyroid operations because of the risk of tracheitis resulting from surgical handling of the trachea Perhaps my considerable experience of intratracheal anaesthesia in these operations might be helpful to your readers in correcting Dr Lewis's bias I have recently completed my 5,000th operation on the thyroid gland (over 3,000 of these operations have been performed under intratracheal anaesthesia) and I am able to assure Dr Ivor Lewis that the incidence of post-operative tracheitis has been negligible and considerably less than in the days when I had to be content with local anaesthesia open ether gas and oxygen with a mask etc

The explanation appears to me to be that a properly fitting and properly introduced tube of suitable material renders the operation so free from the risks of asphyxial symptoms (which are so often met with in other methods of anaesthesia) that traction is reduced to a minimum There is for instance no call to relieve sudden respiratory distress by the effort necessary to dislocate impacted substernal portions of thyroid tissue nor need the operation be hurried in any way

Finally I should like to know what evidence Dr Lewis can adduce that the friction of a smooth intratracheal tube against the mucous lining of the trachea does in fact induce tracheitis under the conditions met with in properly conducted thyroid operations—I am etc

London W 1 Sept 27 CECIL A JOLL

The Radiology of Megacolon

SIR—Megacolon is a rare condition in my practice and I do not feel justified in discussing it but there are physiological variations in the size of the colon which do interest me though Sir Arthur F Hurst (*Journal* September 11 p 551) believes they can all be explained away by the existence of postural tone I must plead guilty, too, to my ignorance of some current literature bearing on this subject but I like to observe facts for myself Later on I am willing to study the views of others

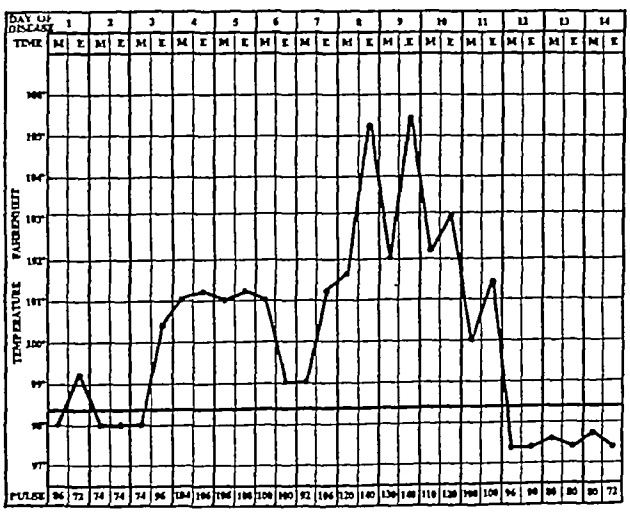
Personal observation taught me the nature of postural tone in the stomach and colon though of course I did not use the term postural tone I also suspected it ensured a constant pressure within the stomach though I had no proof In the stomach of a given individual postural tone will explain the constant level maintained with different amounts of barium but it does not explain why there are marked variations of the level in different healthy individuals These variations are surprisingly wide in the stomach and I am very cautious about describing them as pathological Similar variations exist I believe in all parts of the alimentary tube The different segments of the alimentary canal show functional changes clearly indicated by anatomical and physiological modifications and it does not follow that such a property as postural tone will behave in the same manner in two different segments In comparing the stomach with the colon we must remember that we estimate tone in the stomach in the vertical position under the force of gravity but in the colon the horizontal position is used for barium enemas and gravity is largely counteracted thereby Moreover the stomach possesses an internal elastic air cushion which is often absent in the colon and whose value it is difficult to estimate

Sir Arthur Hurst objects to my estimation of bowel tone by means of a full barium enema which he considers simply indicates distensibility of the large bowel and not its tone What are the facts? My barium enemas are given with three feet of pressure a thinner barium than usual to ensure free flow and as quickly as possible only checking the flow when there is marked discomfort if the bowel is not already fully distended I screen continuously noting the manner in which the bowel expands the rate of passage of barium and the appearance of bowel contour etc

The healthy colon expands quite differently from the megacolon In the latter the bowel is collapsed in the former it is contracted The healthy colon offers resistance to the passage of barium and the degree of resistance can be seen on the screen to be a variable factor—mainly due I believe to the degree of tone When tone is excellent distensibility will be less than when tone is poor for one condition offers more resistance than the other With poor tone and increased distensibility more barium will have to enter to obtain the same degree of internal tension of the muscular coat and pressure within the whole organ necessary to stimulate contraction the

essential preliminary to evacuation Consciousness of this act is also roused at the same time

I regard tone as static contractility Increased tone implies the need for more force to distend a hollow viscus like the colon Diminished tone has the reverse effect The healthy colon never distends to the same extent as the stomach does, but when a certain degree of internal tension has been reached gives the patient warning that evacuation is essential For me this point indicates not merely distensibility but also tone



Professor Sherrington's observations show that the subject is one of great complexity, needing careful study The physiologist studies a typical case, the radiologist studies clinical varieties which include both physiological and pathological variations—that is, applied physiology In spite of the very lucid way in which Sir Arthur Hurst distinguishes between tone and distensibility after a barium enema, I am not convinced from my own observations that these conditions can be dissociated under the conditions named—I am, etc,

London, W 1, Sept 21 JOHN R WYLIE

Idiosyncrasy to Prontosil

SIR—I have recently had the following case under my care, and would be glad of any information (especially from Dr Colebrook of Queen Charlotte's Isolation Block) as to whether prontosil can cause a pyrexia or leucocytosis, and, if so, how to differentiate between the artificial and the real cause, if any, in cases in which prontosil has been given

The patient was a primipara aged 28 and the pregnancy was normal. Delivery took place at 5 a m under chloroform and with the aid of forceps One stitch was required On the second and third days two prontosil album tablets of 0.5 gramme each were given thrice daily as a prophylactic since the confinement was taking place in a cottage with unskilled help On the fourth and fifth days five *p* amino

benzene sulphonamide tablets of 0 25 gramme each were given three times daily the dose being increased on the sixth seventh, and eighth days to six tablets On the ninth day six tablets of the drug were given at 8 a m followed at 11 a m by 30 c cm. of streptococcus antitoxin (Parke Davis and Co) containing 300 U.S A units per c cm On the eleventh day 1 c cm anahaemin B D H was injected There was no further treatment

A blood count taken on the sixth day showed 15 800 white cells per c mm with a differential count of polymorphonuclears 75 per cent lymphocytes, 21 per cent, large mononuclears 2 per cent, transitionals 2 per cent There were no eosinophils basophils, or myelocytes Cultivations from the blood incubated at 37 5° C remained sterile after twenty four hours The urine, which showed an acid reaction, contained a large amount of albumin, but no sugar

The centrifugalized deposit of urine contained some amorphous urates, and epithelial cells No pus, blood, tube casts or further abnormalities were detected No tubercle bacilli were found in specially stained preparations and Gram stained specimens failed to demonstrate the presence of any organisms Cultures yielded a growth of one or two colonies of *Staphylococcus albus* only Cultivations of swabs from the lochia taken on the sixth day yielded a scanty mixed growth of *Staphylococcus albus* and a diphtheroid bacillus The *Streptococcus haemolyticus* was not isolated On the eighth day the *Strep haemolyticus* was present in cultivations made from a lochia swab, but the organism only developed after prolonged incubation On the eleventh day swabs from the lochia and urine showed a trace of albumin The urine yielded a growth of some colonies of the *Strep haemolyticus* but these were not isolated in cultures made from the swab

During the whole time the patient said she felt quite well, but hot at times during the eighth and ninth days, when she was slightly cyanosed and was becoming anaemic On the ninth day she was in a semi-comatose condition, but could be roused She took nourishment well Castor oil was given twice and an enema once, but no magnesium sulphate at any time The uterus involuted normally lochia were normal the whole time No rash or any other symptoms occurred—I am, etc.,

Treatment of Club-foot

SIR—This crippling condition has an evil reputation among us having so often defied the repeated efforts of able surgeons in the past Readers will therefore have rejoiced in the optimistic outlook engendered by the articles from Mr Denis Browne (*Journal* September 18, p 570) and Mr E P Brockman (p 572) These authorities advocate the method introduced by the former and employ his specially devised metal splint This note, while not detracting from their great work, alludes to another current method of treatment which has proved effective and seems to merit reference My interest in this problem, dating from 1920, prompted a contribution to the *Lancet* in 1928 and lingers, although my practice has tended away from orthopaedics lately

The procedure was described last year,[1] and, as the familiar plaster-of-Paris is the splintage used, may appeal to some workers in preference to adopting and mastering a new apparatus It achieves a well-nigh perfect foot both in range and form A distinctive asset of plaster is that the surgeon knows, though the babe is out of his sight, that the corrective force is continuous Movable splints mean a great strain on the co-operation of mothers and others On the doctor, however, chiefly, depends success, for it is he who must recognize the malady and urge the parents to place their infant in competent hands within the first week or two of its life He must gain their consent to the long process of establishing the cure, which may take two years Clearly the enterprise demands devotion of high quality, but this is not more than is commensurate with the use and beauty of the resultant foot—I am, etc,

Bristol Sept 26 A WILFRID ADAMS

[1] *Med Press and Circ* October 21 1936

Technique of Cataract Extraction during Narcosis

SIR,—Mr Basil Graves in his article under this heading in the *Journal* of August 14 (p 319) says that medical thought is accustomed to local anaesthesia and extreme degree of general anaesthesia and not to what he terms surgical narcosis to relieve the mental strain on the average elderly person of consciously submitting to a cataract operation For some thirteen years I have been successfully employing subdermal injection of scopolamine and morphine as a routine to allay the anxiety of the patient during operation not only for cataract but also for glaucoma and squint I brought this to the notice of the Oxford Ophthalmological Congress in 1927 during a discussion in which Mr Basil Graves also took part (*Transactions of the Ophthalmological Society of the United Kingdom* 1927) During the last few years in cases of glaucoma I have been omitting scopolamine and using only morphine hypodermically

Now the difference between Mr Basil Graves's procedure and mine is that he makes the patient unconscious and incapable of co-operating with the surgeon during operation while my aim is to make the patient care free but at the same time to retain his co-operation Is it better to quell the anxiety of the patient while retaining his co-operation or to abolish consciousness and lose co-operation during the operation? To me it seems preferable to remove anxiety and retain co-operation Further can elderly patients who are sometimes arteriosclerotic nephritic diabetic or subject to some other disease stand the very large doses of bromide paraldehyde and omnopon required to achieve Mr Basil Graves's surgical narcosis? In most cases my simple method induces a sufficient amount of sleep after operation to refresh the patient and the nurse does not have to attend to the feeding and to the evacuation of bowels and bladder of an unconscious patient whose sleep may last from seven to fourteen hours

As a rule my patients are propped up in bed on the day following the operation and exceptionally on the same day Often unless the patient prefers to keep in bed he is allowed to sit up on a chair the very next day This has been my practice since 1918 I employed no narcotic before operation until 1924

The points I have raised here are such as are likely to occur to the minds of many surgeons It is with a view to getting light on them from Mr Basil Graves that I have ventured to write this letter—I am etc

Eastbourne Sept 18 D V GIRI

Ether Convulsions

SIR,—With regard to ether convulsions the late S R Wilson's impurity theory is regularly reprinted from one article to another but I had it on good authority from an anaesthetist now also dead who had assisted him in his researches, that this gifted teacher had entirely discarded the theory and was working out a new line of thought which was cut short by his untimely death Accordingly remembering this and several personal experiences when a patient had slight twitching of the face during the isolation of her appendix I had the temerity not to change the ether in the container of the Shipway nor that in the drop bottle (although the former had been used for a case two days previously) it was also used for the three later cases none of which showed the slightest clinical sign of convulsion The details are as follows

The patient was an obese and rather lethargic woman of 24 On the previous day her recumbent blood pressure was 90/70 and the pulse 90 Induction began at 10.33 a.m. with O_2 and CO_2 followed by ether and was uneventful She was placed in the Trendelenburg position since it was thought she might require hysterectomy and the incision was made at 10.48 As the patient had a thick neck and a heavy jaw the airway required constant attention although a rubber tube was *in situ* The uterus was normal but there were many pelvic adhesions and while these were being divided at 10.59 the first slight twitchings began about the face and spread to the abdominal muscles There was slight cyanosis but the pupil remained moderate Ether was abandoned a larger airway substituted and O_2 and CO_2 continued Meanwhile the surgeon completed an appendicectomy and at 11.4 all was normal The patient required no more anaesthetic and was well relaxed for closure The last sutures were in by 11.13

The premedication was by morphine 1/6 grain and atropine 1/100 grain The total amount of ether used was 5 ounces and the temperature of the theatre was 72 Nothing abnormal was reported during the further course

I am indebted to the honorary surgeon for permission to report the case—I am etc

BESSIE E COOK
Doncaster Sept 18 Hon Anaesthetist Royal Infirmary

Aetiology of Erythema Nodosum

SIR,—Dr Lees Templeton's letter in the *Journal* of September 18 (p 599) reporting a case of erythema nodosum has prompted me to publish the following account of a small epidemic of the same condition

Five cases occurred in a family of two parents and five daughters The youngest daughter developed a cold on November 2 1935 a severe tonsillitis supervened a week later and the typical lesions of erythema nodosum appeared some days afterwards. The mother and another daughter went down with severe tonsillitis on November 22 and 23 The mother developed a profuse eruption of nodules on the upper and lower extremities the daughter an eruption on the legs only on December 1 At this time it came to light that the father had had a sore throat a few days before the youngest daughter had been taken ill Peace now reigned in this much-alarmed household until February 12 1936 when two more daughters went down with tonsillitis nodules appearing on their legs on February 22 The age limits were 7 and 47 years

One would hesitate to ascribe such a clinical entity to more than one cause and this experience provides ample proof of a streptococcal origin An equally convincing tuberculous origin was provided by an outbreak of erythema nodosum in a class of school children in Copenhagen a short report of which was printed in the *British Medical Journal* of May 14 1932 (p 893) In view of such experiences one has no option but to accept the general opinion expressed in the opening paragraph of Dr Templeton's letter—I am etc

Chester Sept 22 PHILIP R GRAVES M.D. M.R.C.P.

Expulsion of Placenta Praevia in Advance of Foetus

SIR,—The case of spontaneous expulsion of the placenta in advance of the foetus recorded by Mr J M Nankivell in a clinical memorandum in the *Journal* of September 11 (p 527) recalls an almost identical case which I attended on November 15 1901 in a mining district in County Durham All these years I have been on the look out for a similar case but neither in my reading of the medical literature nor in converse with my colleagues have I heard of one until I came across Dr Nankivell's notes in the *Journal* The history of my case, from notes which I

wrote at the time and have by me as I write now, is as follows

When I arrived at the house the patient was lying in the middle of the bed on her left side with the thighs flexed The placenta was a short distance away, free from the body, with the uterine surface exposed, and the intact cord was seen to lead into the vagina There was comparatively little haemorrhage judging from the state of the bed, which had been left undisturbed On tracing the cord upwards into the vagina I found that I had to deal with a transverse presentation, both hands of the foetus hanging down The umbilical cord was unusually long After giving chloroform I replaced the hands with great difficulty performed podalic version, and extracted the child a boy needless to say dead There was very little post partum loss, and the puerperium was normal This was the mother's third child, she made an uninterrupted recovery, and was, I believe out of bed in a week.

I find nothing recorded as abnormal in the course of this pregnancy, not even any previous haemorrhage The wonder to me in this case was the small quantity of blood that the patient had lost before the expulsion of the placenta and the absence of shock—I am, etc,

LEOPOLD FOTHERGILL M B, B S

Blyth, Northumberland, Sept 25

SIR—In your issue of September 18 (p 598) Professor Miles Phillips mentioned several references in the older literature to this occurrence, and I am glad to be able to inform him that I have enjoyed, during the last few days, reading Dr Smellie's experiences with similar cases, including the one quoted by Professor Phillips, thanks to the kindness of one of your readers who made me a gift of three volumes of Smellie's works dated 1764 One can readily appreciate that many cases of placenta praevia might in those days terminate by spontaneous expulsion of the placenta in advance of the foetus That such a termination was advocated by Sir James Simpson in preference to pulling down a leg after version surely shows what a dangerous procedure, especially if rapid delivery of the aftercoming head were practised, he considered the latter

The reason why such cases do not end in this spontaneous manner nowadays except in rare instances (in spite of Dr O Donel Browne's two cases in ten years they must be rare) is obviously because the condition of placenta praevia is diagnosed earlier and more often and treated by modern methods put into operation at the earliest possible moment after diagnosis has been made reasonably certain

It is generally recognized to-day that the life of the mother is the obstetrician's first concern in a case of placenta praevia The child must be regarded merely as the means by which the mother's life may be saved in certain procedures where the foetus is made to act as a compressor of the placental site and at the same time as a dilator of the cervix Therefore when the half breech is used to plug the lower segment and the cord is seen to be pulsating when the body is born, the natural instinct rapidly to extract the head must be denied, as the lower segment may be thus severely lacerated For this reason, apart from many others, the procedure adopted by the late Dr Willett had much to commend it He applied forceps now known as Willett's placenta praevia forceps, to the scalp of the foetus when the head was presenting The membranes were first ruptured to the side of the placenta, or the placenta perforated if central, and when a secure grip of the scalp was obtained a weight of two pounds was attached to the handles by a tape, the other end of which hung over the end of the bed The advantage of this method is that the forceps can be applied with or without an anaesthetic at an early stage of labour when the os is only one finger dilated, the vertex being born first there is no temptation as with the breech to rush the delivery in an attempt to save the life of the foetus, which incidentally tends to survive in an appreciably greater proportion of cases than it does in half breech deliveries

With the earlier recognition of placenta praevia and its treatment by such methods as Willett's scalp traction, Caesarean section, or pulling down a leg in breech cases, I feel sure that very few cases such as I reported will be met with in the future—I am, etc,

J W NANKIVELL

Medical Reference in Early Wills

SIR—The will (1585) of Thomas Lord FitzWalter, Earl of Sussex, is of medical interest in its evidence of recognized differentiation in Elizabethan days of the physician, surgeon and apothecary, for the testator bequeathed £50 to William Dunn his physician, £20 to William Clowes his surgeon, and £20 to Robert Perpoint his apothecary for their pains The will (1504) of Richard Heigham (barrister at-law) is also of interest in its proof that there were women at that time who nocturnally administered to the sick, for the testator left a small legacy to the 'woman that wacched with him on nyghts

Elizabeth Drury in her testament (1465) expressed her appreciation of the diligence that her physician, Master Wotton, had taken (John Somerset, both Physician to Henry VI and Chancellor of the Exchequer 1434–42, was addressed as Master) One finds in the early Tudor period that a physician in witnessing a will gave his qualification as that of Master of Arte. In such form the royal physician, Sir William Butt, signed It is in the later Tudor period that one first traces—in Thomas Fraunces, 1574—the Doctoure of Phisicke This doctor bequeathed to his colleague—Doctoure Gifford—his "best velvet cote"—I am, etc,

Birmingham, Sept 16 M E PROSSER

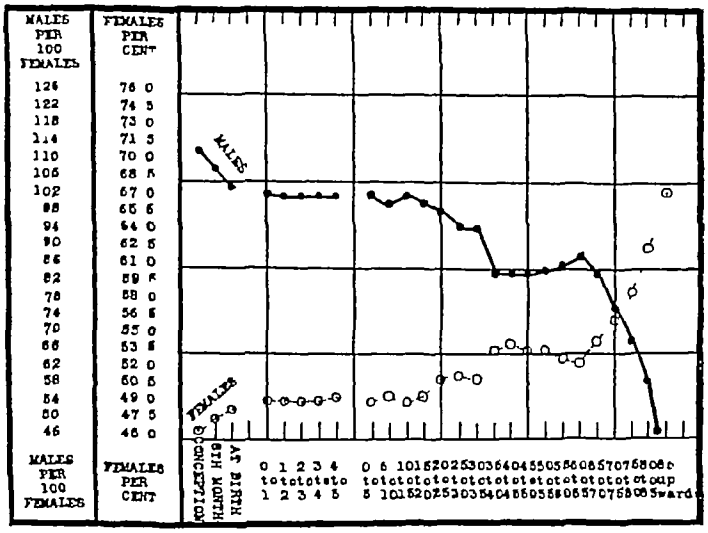
The Shopman's Finger Lick

SIR,—I entirely agree with your correspondent Dr Hubert C Bristowe (September 18, p 601) on the insanitary practice of some shop keepers in using a licked finger to assist the picking up of paper and bags, and would refer to the equally objectionable practice, often by the same "finger-licker," of blowing into paper bags in order to separate the flattened sides Such a habit is even more likely to infect the inside of the bag This latter practice is much rarer than formerly, because the modern paper bag is manufactured with one lip slightly longer than the other to facilitate opening, a slight flick in the air while the bag is held by the long lip being sufficient to open it

It is difficult to see how health authorities can take any action in the matter beyond drawing the attention of those engaged in the handling of food to the undesirability of the practice I am assured by the manager of a large local firm that he would immediately check any such practices if he observed them in his shop As in so many other matters of this sort, the general teaching of hygienic principles to the public must be relied upon to abolish such customs, which are aesthetically undesirable and potentially dangerous, even though the actual extent of the part they play in the spread of disease may be incapable of estimation—I am, etc

R CAUTLEY HOLDERNESS

Loughborough, Sept 22 Medical Officer of Health



The Sex Ratio

Sir,—The tables showing the ratios of sex in the population of England and Wales for the years ending the middle of 1934 and the middle of 1935 as embodied in the Registrar General's Reports (years 1935 and 1936 the latter just published) present some interesting data which are the more arresting if the *absolute* numbers as printed in the reports are converted into *percentages*.

Except for the first two items which are based on estimates made by cytogeneticists the accompanying table and graph represent the mean figures for the two years in question. These show a very remarkable trend of the sex ratio from a preponderance of males at conception (113·67 *m* to 100 *f*) to equality of the sexes at or about the age of 20, after which there is a preponderance of females until at 85 years of age and onwards this amounts to 100 of that sex to 47·8 males.

Age	Females per cent. of Population	Males to every 100 Females	Age	Females per cent. of Population	Males to every 100 Females
Conception	46·8	113·67	20—25	51·0	96·37
8th Month	47·7	109·64	25—30	51·3	95·05
Birth	48·8	104·91	30—35	51·2	95·13
			35—40	53·8	85·95
0— 1	49·1	103·94	40—45	54·2	84·58
1— 2	49·3	103·09	45—50	54·0	85·21
2— 3	49·3	102·95	50—55	53·9	85·65
3— 4	49·4	102·63	55—60	53·3	87·80
4— 5	49·5	102·22	60—65	53·2	88·10
			65—70	54·3	84·40
0— 5	49·3	104·95	70—75	56·5	77·78
5—10	49·6	101·85	75—80	59·3	68·87
10—15	49·5	102·02	80—85	62·7	59·56
15—20	49·7	101·35	85 upwards	67·7	47·80

Table showing percentage of females, and number of males to every 100 females at various periods of life out of the mean total population of England and Wales for 1934 and 1935 (40,556,000)

Graph showing numerical decline of males to females. The abscissae represent ages, the ordinates (left figure column) the number of males to every 100 females, the right figure column the percentage of females. Mean total population of England and Wales for 1934 and 1935 equals 40,556,000.

In his masterly presidential address before the Zoological Section of the British Association, Professor F. A. E. Crew, after calling attention to this remarkable swing in the secondary sex ratio said: "Amongst the 20–24 year-olds the females actually begin to outnumber the males, and thereafter, as age group succeeds age group, this female numerical ascendancy progressively increases until among the 85's and over there are more than twice as many women as men." Professor Crew bases his statement on the Registrar General's Report for 1936 only. I think that had he taken more than one year's figures into account he would have found that the sex-equality age is higher than 15–19 years of age as he states, and also that the female numerical preponderance is not strictly speaking, progressive. After a sudden rise between the ages of 30 and 35 this ascendancy suffers, *from the age of 40 to 65, a slight but very definite* lowering after which it leaps upward until as Professor Crew says, the number of women is double that of the men. It is to this curious lowering of the female sex ratio that I wish to call attention. I presume it is not unconnected with the enhanced liability to disease in the years immediately succeeding the climacteric. Perhaps, however some of your readers can offer a better explanation.—I am, etc.

CHARLES M. BEADNELL
Surgeon Rear-Admiral R.N. (Ret.)

Egham, Surrey, Sept. 18.

International Postgraduate Congress

Sir,—I have read with deep interest but deeper misgiving the account you published (*Journal*, September 11, p. 542) from Colonel A. H. Proctor, Dean of the British Postgraduate Medical School, of the Third International Congress on Postgraduate Medical Education held recently in Berlin when a large majority approved the establishment of an international academy for postgraduate work and research which would serve a very useful object not only in promoting medical progress but in *furthering international fellowship and friendship*. Might one ask in all sincerity how this aim is compatible with the official German attitude towards medical teaching and research? This was stated clearly and unequivocally by the Reich medical leader Dr. Wagner in opening the congress.

"The doctor's chief duty was to combat those conditions which history shows have caused nations to perish—namely (1) the decline of births, (2) the swamping of the best and most capable parts of a nation by those elements which had no right to existence, (3) the mingling with the blood of a different race. The chief task of the *German* doctor lay in promoting all measures which would strengthen the health and vigour of *German* individuals." (The italics are mine.)

Are we in this country to subscribe to this creed or shall we rather stand with Osler and avow:

"By his commission the physician is sent to the sick and knowing in his calling neither Jew nor Gentile bond or free perhaps he alone rises superior to those differences which separate and make us dwell apart too often oblivious to the common hopes and frailties which should bind us together as a race. In his professional relations though divided by national lines, there remains the feeling that he belongs to a

guild which owes no local allegiance, which has neither king nor country, but whose work is in the world The Aesculapian temple has given place to the hospital, and the priestly character of the physician has vanished with the ages, still, there is left with us a strong feeling of brotherhood, a sense of unity, which the limitations of language, race, and country have not been able to efface

How was this congress called—by an international committee or a German committee only? Which bodies providing postgraduate education in this country were asked to send delegates? How many accepted the invitation? How far were these delegates committed to the establishing of an international academy for postgraduate work in Berlin? An international body might rightly welcome the co operation of all nations in its deliberations, however abhorrent their internal policies or politics might be to other peoples But when an international congress which has remained inactive for twenty-four years is abruptly revived with the "generous help and assistance" of a Government which has substituted in medicine the slogan '*Heil*—or Farewell" for the Hippocratic precept "Where the love of man is, there also is love of the Art," the above and several other questions arise and should be answered before we support a project which raises the suspicion of a deliberate endeavour to introduce racial and national antagonisms into medicine for political ends—I am, etc,

University of Liverpool, Sept 27 HENRY COHEN

"The Other Half" of Medicine

SIR—I do not propose to follow your correspondent s excursion into the question of what is or is not good taste (September 18, p 598) I should, however, like to say something about the matter of exact quotation Those of us who practise psychotherapy are frequently being told by patients that the doctor has told them that there is nothing wrong physically in any way, and that all the same he prescribed a physical remedy To them as to us such a procedure has appeared illogical When we quote these patients we are solemnly warned not to believe everything the patient says If we give a generalized résume of what the doctor did say we are told that we have suppressed some important point, and now if we quote verbatim we are apparently not behaving properly The 'half of the medical profession" which your correspondent has taken on himself to represent are often not slow to accept any story from a patient as to what a psychiatrist or psychoanalyst is supposed to have said to his patient Would not exact quotation be better?

And again, surely no physician who truly believes that mental conflicts are best resolved by bromide, luminal, and the administration of glucose need be ashamed to have his exact words quoted I will agree that had I given the least hint which might have identified the persons involved publication would have been outrageous, but as nobody can have any idea from my letter who they are I feel justified in saying what I did say—I am, etc,

London W 1 Sept 21 E B STRAUSS

Post-mortem Examinations in Inquest Cases

SIR—There can, I am sure, be no dispute as to the pertinence and propriety of Mr Brooke s remarks (September 25, p 639) concerning the importance of post-mortem examinations in inquest cases, and more particularly those of the type of which he quotes two illustrative and illuminating examples It occurs to me, however, that there is an effective way out of such difficulties which might be interpreted as a form of mild coercion upon recalcitrant coroners, and that is a simple refusal by doctors to give any definite opinion as to the cause of death without performing a post mortem examination in any case in which there is the slightest doubt

A doctor is only required to certify a cause of death to the best of his knowledge and belief, and in the circumstances there is not the slightest necessity for him to strain his conscience by a too liberal interpretation of his duty in this respect In my opinion he will have completely discharged his obligation by a simple, straightforward, and courageous refusal to state the cause of death in cases where the circumstances do not warrant his doing so There is just one reservation that I have to make, and that is that post-mortem examinations of this nature should not be entrusted to junior house officers, but should only be performed by pathologists trained for this type of work, of whom there are numbers available all over the country

Finally, Mr Brooke s *cri du coeur* is in danger of falling upon deaf ears, because coroners with medical training are in the minority I would suggest to him that a copy of his letter, perhaps a little modified, might with profit be sent to any of the journals which are published exclusively for the benefit of lawyers—I am, etc.,

London, E C, Sept 25 L F BECCLE.

"County Homes for Cancer"

SIR,—I notice a letter in your issue of September 25 from Dr Hamish Wallace with regard to this appeal I enclose a copy of the appeal which was issued in Yorkshire along with invitations to a meeting in York on September 25 So far as I can gather the invitations were issued to numbers of the wealthy laity, but to very few of the medical profession

We at the Leeds Infirmary felt so strongly that this appeal was likely to divert the contributions of the charitable, from existing and well organized hospitals in which the treatment of cancer is being actively carried on, to a nebulous and unpractical scheme, that I was asked to write a letter to the various papers of Yorkshire, a copy of which I enclose

I and others actively interested in hospital administration in the West Riding attended the meeting in York on September 25 It was poorly attended, no really practical suggestions were offered by the two speakers on behalf of the project, and no information was given as to the people who would administer any money subscribed No resolution was proposed and the majority of those present felt sympathy for the generous people who had promised contributions The Earl of Feversham, who occupied the chair and conducted the meeting with the courtesy and tact which is so characteristic of him, earned the gratitude of everyone present

The scheme appears to me to be so unpractical that it would perhaps be wise to ignore it after the comments which have already been made I hope that in Yorkshire, at any rate, it is dead I think it is—I am, etc.,

hand, are also closely analysed Apparently—a minor point—the experts did not group the bloods of the remains for comparison with the group characters of the blood found in Ruxton's house Correspondence would have provided, if not a link, at any rate a corroborative point Perhaps they already had so much that they felt they did not need any more Previous cases of dismemberment and mutilation are summarized in one appendix and a second collects a number of previous comparisons of skulls with portraits

DEED OF CONVEYANCE DOCTOR'S SUCCESSFUL CLAIM

The Judicial Committee of the Privy Council, known for short as "the Board," gave judgement on July 19 in a case which might—as Sir Lancelot Sanderson said in delivering the Board's judgement—almost be described as *sui generis* Mrs Johnson, a widow of 82, fell down and hurt herself at about the beginning of August, 1930 She was attended by a Dr J A Williams, who had also attended her in an illness in 1928 He was not her family doctor but an intimate friend, he made no charge for his professional services, and said he never regarded her as a paying patient. In about a month she was well again On February 4, 1931, she executed a deed conveying to Dr Williams a house and land in Freetown, Sierra Leone The price named was £1,500, but it was never meant to be paid, and the transaction was for legal purposes a gift

The law looks very jealously on gifts, and the court will always intervene to upset a gift if it considers that the recipient had some special influence over the donor The law presumes, for instance, that a parent has special influence over his child, a man over his wife, a solicitor over his client, and a doctor over his patient Where one of these, among other, relationships exists between the donor and the recipient at the time of the gift, the court will set the gift aside unless the donee can prove that the donor gave it spontaneously and in circumstances which enabled him to exercise an independent will In 1933 Mrs Johnson applied to the court to have the transaction set aside and the house and land conveyed back to her on the ground that she had executed the deed under the influence of Dr Williams without independent advice The court had therefore to decide two questions whether the relationship of doctor and patient existed and, if it did, whether the doctor had proved that he did not in this particular case exercise the special influence which a doctor is always presumed to exercise over his patients

The case was tried at first instance by Chief Justice Webber His Lordship, after hearing the evidence, held that the relationship between Mrs Johnson and Dr Williams was more like that of mother and son, and that it was difficult to understand how " a casual attendance on two occasions' could create a confidential and fiduciary relationship He was also satisfied that the gift was the result of the free exercise by Mrs Johnson of her independent will *Mrs Johnson then took the case to* the West African Court of Appeal, who decided against the learned judge on both points They thought that the parties were doctor and patient, and that the doctor had not rebutted the presumption of influence

Appeal to the Judicial Committee

The doctor thereupon appealed to the Judicial Committee of the Privy Council, who reversed the Court of Appeal on the second point and confirmed the judgement of Chief Justice Webber They agreed that the Court of Appeal were right in finding that the professional relationship existed, and that the learned Chief Justice was wrong in speaking of ' a casual attendance on two ocasions ' The doctor, said the Board, had attended the old lady through two illnesses but the illness of August, 1930 was clearly no light matter and afforded just such an opportunity for generating those feelings of confidence and gratitude calculated to produce the influence (no doubt unconsciously operative) which creates a desire to confer benefits on the medical adviser and against which the patient requires protection' It was therefore necessary the Board found, that the doctor should prove that the gift was not tainted by this influence, and the Board discussed the means by which such a presumption can be rebutted

"Influence" Disproved

The most obvious way is to show that the gift was made after the nature and effect of the transaction had been fully explained to the donor by some independent and qualified person In many cases (as the House of Lords have said[1]) this may be the only means of proof, and if evidence is given of circumstances sufficient to establish freedom of will they are not to be disregarded simply because they do not include advice from a lawyer Chief Justice Webber found that Mrs Johnson was aware of the true nature of the transaction, deliberately chose a conveyance in preference to a deed of gift, signed it well knowing its contents, and had the contents read out to her and understood them all, he was therefore satisfied that she had freely exercised her independent will The Board had to satisfy themselves that there was evidence which justified his Lordship in this finding Mrs Johnson had a solicitor whom she chose herself to prepare the deed This was not in itself sufficient because it was not proved that he knew all the relevant circumstances, and especially the total of Mrs Johnson's property and its relation to the size of the gift The really important evidence before Chief Justice Webber was, however, that of Mrs Johnson herself He concluded that she was well educated, betrayed no sign of mental weakness and had competently administered her son's estate She was, in fact an intelligent, astute and strong-willed woman The Board therefore found that the doctor had displaced the presumption of influence and was entitled to keep the gift

The exceptional feature of this case and perhaps the decisive one, was the fact that Mrs Johnson was alive and able to give evidence so that her visible personality belied her assertion that she had not exercised an independent will Usually, as the Board pointed out the donor is dead, and the donee has to prove his case by less direct and more difficult means

The Services

ARMY MEDICAL SERVICES

The War Office announces that Colonel R C Priest M D, F R C P, K H P Professor of Tropical Medicine Royal Army Medical College, and Consulting Physician to the Army will be promoted to the rank of Major General (supernumerary) as from October 13, and will continue in his present appointment

The King has awarded the Military Cross to Captain J W Orr R A M C for gallant and distinguished service in action in connexion with the operations on the North West Frontier of India, 1937

The King has conferred the Territorial Decoration upon Lieut.-Colonel J O Thomas *M C* Major and Brevet Lieut Colonel J Marshall *M C* and Major W R Martine M B E., R A M C (T.A)

ARMY DENTAL CORPS

The War Office announces that applications are invited from dental surgeons for appointment to a limited number of commissions in the Army Dental Corps Candidates will be selected for these commissions without competitive examination, and will be required to present themselves in London for interview and physical examination towards the end of October They must be registered under the Dentists Acts or Medical Acts and be not over the age of 28 Successful candidates will in

[1] *Inche Noriah v Shaik Allie* 1929 A C 127

the first instance be given short service commissions for six years, at the end of which period they will retire with a gratuity of £1,000 unless they have been granted permanent commissions Permanent commissions will be given to officers selected from among those who wish to make the Army their permanent career Full particulars of the conditions of service and emoluments also form of application may be obtained from the director, Army Dental Service, the War Office S W 1

DEATHS IN THE SERVICES

Lieut-Colonel Osborne Henry Channer, Bombay Medical Service (retired) died at Fordingbridge Hants on September 16 aged 84 He was born at Allahabad on August 21 1853 the fourth son of the late Colonel George Girdwood Channer and was educated at Edinburgh where he graduated as M B and C M in 1876 Entering the I M S as surgeon on September 30 1876 he became lieutenant colonel after twenty years service and retired with an extra compensation pension on April 15 1907 He served in the Afghan War of 1879-80 when he was mentioned in dispatches in G G O No 375 of 1880 and received the medal

Universities and Colleges

UNIVERSITY OF WALES

Welsh National School of Medicine

The opening address for the new session of the Welsh National School of Medicine will be given in the lecture theatre of the Institute of Physiology Newport Road Cardiff by Sir Joseph Barcroft F R S emeritus professor of physiology in the University of Cambridge on Friday October 8 at 5 p m The subject of his address is "Physical Unfitness" The Bishop of Monmouth President of the School will take the chair

UNIVERSITY OF DURHAM

Lord Eustace Percy Rector of King's College will give the inaugural address of the winter session 1937-8 in the Examination Hall of the Medical School King's College Northumberland Road Newcastle upon Tyne on Friday October 8 at 4 15 p m His subject is Medicine and Government

UNIVERSITY OF LONDON

University College

Dr Phyllis Tookey Kerridge will give a course of four lectures on The Physiology of Hearing and Speech at University College Gower Street W C, on Mondays October 11 18 and 25 and November 1 at 5 p m The lectures are open to the public without fee or ticket

UNIVERSITY OF LEEDS

The following candidates have been approved at the examinations indicated

M D—J H Crawford R S Illingworth I Macpherson N W Roberts P Science

Final M B Ch B—*Part I* J R Acfield A B Dick C A Everatt A F A. Fairweather D G Huntly J Jackson H Levine Marjorie Marquis Jean Middlemiss C T Roberts C R Robson Dorothy E Rowling, J L Sharp J P Watson H D Whiteley *Part II* N Baster Eileen M Bateson Joan M Bateson R Cargill H Cohen S P H Fergus K M Fox S Levy L Roberts I Smith F W Wigglesworth *Part III* K B Aske N Baster Eileen M Bateson Joan M Bateson R Cargill H Cohen S P H Fergus K M Fox, V P Geoghegan S Levy L Roberts H Silverman I Smith Mary Townend F W Wigglesworth

Diploma in Psychological Medicine—Margaret C Campbell Gwendoline D Knight, H Shaffer

D P H—F C Hyland

The West Riding Panel Practitioners Prize and the William Hey Gold Medal have been awarded to James Albert Rhind

In presenting the report for 1936 of the Winsley Sanatorium the chairman of the executive committee welcomed the presence of Dr Lionel A Weatherly who was the first chairman of the executive committee constituted in 1899 for the building and maintenance of the sanatorium A tribute was paid to Dr Weatherly for his outstanding services in promoting the establishment of the sanatorium

Medical News

Sir Humphry Rolleston will give the inaugural address at the opening of the ninety sixth session of the School of the Pharmaceutical Society of Great Britain on Wednesday, October 6, at 3 p m, at 17, Bloomsbury Square, W C

The Dean and School Committee of University College Hospital Medical School are giving a reception in the library of the Medical School on Tuesday next, October 5, at 4 p m Tea will be served in the library

The annual prize distribution and conversazione will take place at the Royal Dental Hospital of London School of Dental Surgery Leicester Square W C, on Tuesday, October 5, at 8 p m when Sir Cuthbert S Wallace, Bt., P R C S, will preside

Dr Charles E Wheeler will give an address entitled A Hundred Years of a Heresy in the Hastings Hall, B M A House Tavistock Square W C., on Friday, October 8 at 5 p m Medical men and women are invited to attend this lecture, which is introductory to a course arranged by the London Homoeopathic Hospital, Great Ormond Street

A special course on the psychology of crime is to be provided for magistrates by the Tavistock Clinic Malet Place W C 1 Matters to be studied during the course, which begins on October 5 include the delinquent effects of poverty, unemployment wrong discipline and other social ills, and of such physical conditions as epilepsy encephalitis lethargica toxic conditions and gland disturbance

The eighteenth French congress of orthopaedics and traumatology will be held in Paris under the presidency of Dr E Sorrel on October 8 and 9, when a report by Drs Leveuf of Paris and Perrot of Geneva on tendon transplantations in infantile paralysis will be presented

On September 23 Professor W W Jameson M D dean of the London School of Hygiene and Tropical Medicine, formally opened the extensions of the Ham Green Hospital, recently provided by the Bristol City Council The scheme now completed comprises two small pox blocks and mortuary a block for general infectious cases and an extension to the nurses home the amount of the contract for the whole scheme was £39 541 The Lord Mayor of Bristol presided over the opening ceremony and the Bishop of Bristol offered a dedicatory prayer Professor Jameson expressed the opinion that there was no city in the land where modern progressive local government might be studied with greater profit than Bristol

Pamphlet No 112 issued by the Board of Education is entitled *The Education of Backward Children* and has special reference to children who are backward because they are innately dull It is published by H M Stationery Office at 1s The authors are a group of H M Inspectors who have made a special study of the subject, and their purpose to suggest to teachers generally some educational principles upon which to base their practice

Dr Harvey Cushing has resigned his chair of Sterling Professor of Neurology at Yale University School of Medicine but will continue his association with the University as director of studies in medical history and will retain the rank of professor

Dr L Haden Guest *M C* is the Labour candidate in the forthcoming Parliamentary by election at North Islington

The cholera epidemic in Hong Kong still persists and according to the Hong Kong correspondent of *The Times* there have been 1,622 cases between July 20 and September 21.

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to The EDITOR British Medical Journal B M A House Tavistock Square W C 1

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated Correspondents who wish notice to be taken of their communications should authenticate them with their names, not necessarily for publication

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Secretary B M A House Tavistock Square W C 1, *on receipt of proofs* Authors overseas should indicate on MSS if reprints are required as proofs are not sent abroad

All communications with reference to ADVERTISEMENTS should be addressed to the Advertisement Manager Orders for copies of the *Journal* and communications with reference to subscriptions should be addressed to the Secretary B M A House Tavistock Square W C 1

The Telephone Number of the British Medical Association and the *British Medical Journal* is EUSTON 2111

The Telegraphic Addresses are

EDITOR OF THE *BRITISH MEDICAL JOURNAL* *Aitiology Westcent London*

SECRETARY *Medisecra Westcent London*

The address of the B.M A Scottish Office is 7 Drumsheugh Gardens Edinburgh (telegrams *Associate Edinburgh* telephone 24361 Edinburgh) and of the Office of the Irish Free State Medical Union (I M A and B M A) 18 Kildare Street Dublin (telegrams *Bacillus Dublin* telephone 62550 Dublin)

QUERIES AND ANSWERS

Irritation Around Urethral Meatus

"W E S writes I would greatly appreciate the comments of readers upon the following case A man aged 43 suffers from irritation and redness in the periurethral region of the glans penis The foreskin is lax and completely covers the glans The condition is made worse by a bus journey or prolonged sitting in a chair All local sources of irritation have been eliminated and the genito urinary system fully investigated

Lymphatic Oedema

Dr W J Burns Selkirk (Birmingham) writes in reply to G P (*Journal* September 18 p 604) I have a note 'Blue legs with subcutaneous thickening push vitamin D As the patient in G P s case has menorrhagia she will be losing much calcium. The use of vitamin B in soft oedema is described in the *British Medical Journal* of February 27, 1932 (p 374)

Medical Treatment for Dupuytren's Contracture

Dr Cresswell Davis (Burnham Road Highbridge Somerset) in reply to Nadaud (*Journal* September 25 1937 p 642) writes I have treated in adults several severe cases one bilateral for which amputation had been advised by surgeons of repute The patient is instructed to get a series of small rubber balls of graduated size—the smallest just big enough to press firmly between the flexed fingers and the palm This ball is kneaded with the affected fingers for definite periods each day, and kept in place at night by means of a webbing strap round the dorsum of the hand and the ball As the desired extension is obtained larger and larger balls are used Gradual extension and movements aided by the opposite hand are also insisted upon In one very severe case (bilateral) in a mechanic in six weeks the fingers previously firmly held in contact with the palms of the hands had 75 per cent full extension and the patient could shave himself for the first time for twelve years I hope to collect a few more cases with 'before and after photographs for publication eventually In the meantime I shall be pleased to give Nadaud any further information if he would care to write to me I suggest an over size glove or mitten to keep the ball in place at night in the case of a child

Income Tax

Public Appointment Motor Car Allowance

"Claim is one of a number of assistant medical officers who have not been given a car allowance by the appointing authority but only third-class rail or bus fares except in special circumstances All the facts have been annually placed before the income tax authorities and a deduction for the incurred cost in running cars has been claimed and granted Recently claims have been refused and a demand is being made for tax on past allowances

*** It is unlikely that the claim to the allowance would be upheld on appeal The Act requires the expenses to be incurred necessarily in carrying out the duties and the local authority s allowance would probably be regarded as all that was necessary ' As regards past years the revision can be made if the inspector has discovered an under assessment. Seeing that he had all the facts before him the question of discovery is open to argument but recent judicial dicta might be construed to support the proposed demands In the circumstances we suggest that our correspondent might write to the Board of Inland Revenue, Somerset House W C 2, pointing out the hardship resulting from altering the assessments for past years and asking—without prejudice to the legal point—that as an act of grace the assessments for those years be left undisturbed

Occupation Rent Free by Assistant

"House is an assistant and lives rent free in premises owned by his principal Who should pay the tax assessed on the property under Schedule A?

*** The principal is entitled to deduct as an expense of carrying on the practice the amount of the Schedule A assessment and if as we assume he has been allowed that deduction the liability to pay the amount of the tax thereon would seem to be his

LETTERS, NOTES, ETC

"The Role of Chemiotaxis in Bone Growth"

Mr A P Bertwistle F R C S Ed writes Your reviewer of the book with the above title complains that I have added another word to an overburdened nomenclature How else can one express a new process but by coining a new word? Incidentally by this process one is enabled to vindicate John Hunter s dictum that the blood vessels bring bone to its destination Chemiotaxis is a long word to express the search for food The lowly amoeba possesses no eyes, ears or a nose, and yet it is capable of moving towards and ingesting bacteria in the soil as its cousin the leucocyte does in animal tissues This search for food is one of the basic principles of life and is nowhere seen to better advantage than in plant life hence the subject of Chapter I To seek new insight into the nature of the process *whereby developing structures follow particular* pathways' is almost as difficult a task as finding the origin of life, which will probably be for ever veiled in mystery

Disclaimer

Dr John C Hodgson writes The clinical memorandum written by me on 'Parkinsonism following Peripheral Trauma which appeared in the *Journal* of September 18 has resulted in a column in the Manchester edition of the *Daily Express* with my name and address in large type I wish to disclaim all responsibility for this unauthorized publicity

Buccal and Lingual Ulcers

Mr Herbert Tilley wishes to correct a statement he made in the *Journal* of September 18 (p 564) in response to the request of Puzzled for suggestions as to the treatment of a patient suffering from buccal and lingual ulcers In my reply he writes I advised a trial of Bayer and Co s preparation known as campolon because it had given rapid and successful results in three of my own patients who failed to respond to full doses of iron arsenic and other haematinics I was well aware that the remedy suggested was one of the 'liver extracts and that this type of therapy had long since proved efficacious in the treatment of certain of the grave anaemias But in conversation with a well known pharmacist previous to forwarding my advice to your correspondent I gathered the impression that campolon was an extract of cod and halibut liver oils Herein laid my mistake which I hasten to acknowledge

Corrigendum

We regret that in a paragraph on bacterial flora at high altitudes published on September 18 (p 572) there were several typing errors which should have been corrected The words mycobacteria and bacteria were misspelt and the last five words of the paragraph should have read *bacillus subtilis* and *bacillus mesentericus*

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

252 Functional Capacity of Limb Arteries

M RATSCHOW (*Munch med Wschr* July 16 1937, p 1128) describes a very simple and cheap ergometer suitable for the determination of the degree of narrowing of peripheral arteries His investigations have proved that the functional capacity of the vessels and therefore of the limb decreases with age The functional capacity is also decreased when the limb is elevated and increased when it is lowered In functional arterial disturbances the amount of work which the limb can perform painlessly is considerably decreased, and whereas in the normal limb there is a wide gap between muscular exhaustion and the onset of pain this is reduced to a minimum in the presence of vascular disturbances In arteriosclerosis both limbs behave abnormally when tested with the ergometer though clinically only one limb may be affected In 54 per cent of diabetics over the age of 40 the tests proved that the functional capacity of the arteries had decreased The method can be used for the differential diagnosis between pain due to ischaemia and that of different origin It is also useful for determining the degree of improvement following a course of treatment

253 Tests of Cardiac Function

G NYLIN (*Zbl inn Med* June 26 1937 p 529) describes recent clinical investigations at Stockholm into cardiac function He attaches considerable value to the measurement to the heart volume and to the oxygen debt of Hill The former is readily and accurately estimated by Kahlstorf's formula based on frontal and sagittal radio orthodiagrams and is best considered with reference to the body superficial area Nylin also works out a correlation coefficient by dividing heart volume by output as reckoned from minute volume and finds that this index is fairly constant in healthy persons at rest As cardiac decompensation increases the volume increases and the output diminishes so that an index of 40 or over, as compared with that of about 10 and 9 in healthy adults and children respectively is not uncommon The author's work confirms that of Lewis and Grant in showing that valvular errors *per se* carry a better prognosis than was formerly thought The reckoning of the oxygen debt after graduated exercise on a staircase shows that both in mitral and aortic disease a normal or only slightly increased heart volume and oxygen debt may coincide and justify a fair prognosis A normal debt was found in a youth who played strenuous games without cyanosis or distress and who had been excluded from military service The case is also recorded of a pregnant woman with mitral stenosis and lung stasis who went to term without trouble her heart was not enlarged and the oxygen debt was only 27 per cent Usually, however, clinical signs of decompensation go with a high oxygen debt of from 40 to 100 per cent In hypertonic subjects functional tests are significant, and may show cardiac enlargement or a high oxygen debt without clinical signs of insufficiency

254 Causes of Bronchiectasis

P M ANDOUS (*Amer Rev Tuberc* July, 1937, p 46) has analysed the causes of bronchiectasis He is of the opinion that the theory that bronchiectasis is due to destruction without mechanical dilatation is untenable The possibility of its resulting from the normal elastic pull of the lung in the presence of an unusually severe infection should be admitted Most cases however result from a superimposed dilating stress of abnormal intensity A detailed examination of the various physical forces currently held to cause bronchiectasis was attempted The author found that the agents producing ectasia from within the bronchi—namely a gas pressure effect due to negative pressure of the pleural space cough partial bronchial obstruction and to the presence of secretion—did not usually exert any dilating stress upon them This also applied to the case of ectasia from outside the bronchi by retraction of fibrous tissue or the normal inspiratory dilatation of the bronchi He points out that pulmonary atelectasis is by far the most important and usual antecedent of bronchiectasis It occurs in the development and healing of all types of pneumonic diseases At the same time bronchiectasis is generally admitted to have its clinical origin in the same class of disease Further patchy airlessness seen radiographically is the most constant and conspicuous feature The common association of fibrosis with bronchiectasis has led to the general assumption of a causative relationship The author concludes that pulmonary atelectasis furnishes the most logical and probable explanation of most cases of bronchiectasis

255 Malignant Hypertension with Suprarenal Tumour

F THIEBAUT I GUILLAUMAT and A PLACA (*Presse med* July 3 1937 p 990) describe a case of malignant arterial hypertension in which a tumour of the suprarenal cortex was found at necropsy The patient was an unmarried woman aged 29 whose symptoms included severe headache vomiting diminution of vision and diplopia and epistaxis and cutaneous ecchymoses On examination the skin was dry and pigmented there was hypertrichosis and the breasts were poorly developed The fundi showed marked papillary oedema and numerous retinal haemorrhages Blood pressure was 240/150 mm Hg The pressure of the cerebrospinal fluid was below 24 (Strauss's manometer) but was otherwise normal An exploratory operation failed to reveal any cerebral tumour Decompression was performed and temporary improvement followed but a month after operation the general condition grew worse and the patient died six weeks later—one year after the beginning of the illness At necropsy a large tumour of the left suprarenal body weighing more than 220 grammes a pulmonary metastasis cerebral oedema sclerotic kidneys, and senile ovaries with neither Graafian follicles nor corpora lutea were found the figure tended towards the masculine type No cerebral tumour was present, but there was a pressure cone The suprarenal tumour was an epithelioma of the cortex Signs of renal insufficiency were not marked until a few days before death The authors are inclined to believe that the malignant hypertension cerebral oedema, etc, were secondary to the suprarenal tumour

256 Infantile Miliary Exanthem

A STROL H STROI and D HORTOPAN (*Ann de Méd*, May 1937 p 379) give an account of an epidemic of an eruptive and infectious disease which occurred in children in Bucarest The course of the disease consisted in a stage of invasion characterized by fever an exanthem affecting the mucous membrane of the nose, mouth and pharynx, followed by a scarlatiniform or morbilliform eruption accompanied by vesicles and profuse perspiration and the next stage was a furfuraceous desquamation The incubation period was from six to fifteen days and the period of eruption from two to eight days There was a slight leucocytosis, the mononuclear cells forming from 60 to 80 per cent of the leucocytes Mild average and neurotropic types are described The nervous type was characterized by convulsions, tetanic contractures, insomnia

and restlessness, exaggerated reflexes, general hyperaesthesia, vasomotor disturbances with cyanosis of the extremities, intracranial hypertension relieved by lumbar puncture, and paresis, paralysis, and psychic troubles Encephalitis followed by athetoid movements of the hands and retarded mentality was occasionally seen The prognosis was usually good except in infants, and the mortality rate was about 5 per cent, death being commonly due to bronchopneumonia, cancrum oris, or convulsions In this series all the deaths occurred in infants under 1 year of age The disease is probably due to a filterable virus and the inoculation of rabbits with liquid from the vesicles by corneal scarification resulted in encephalitis The authors consider this condition an entity which can be separated from the other exanthemata

Surgery

257 Perforated Ulcer of Transverse Colon

M Helman (*Lyon Chir* May–June, 1937, p 318) reports a case in which a perforated ulcer of the transverse colon was discovered during an exploratory laparotomy The patient was a woman, aged 34, who had suffered for several years from habitual diarrhoea and from pain in the left flank The pain suddenly became very severe, the diarrhoea increased, the temperature rose, and there was meteorism A tentative diagnosis of obstruction or of peritonitis of unknown origin was made Laparotomy was carried out and revealed a gross dilatation of the transverse colon and inflammation of the omentum The great omentum was adherent to the transverse colon and when this had been freed a perforation of the colon similar to a perforated gastric ulcer with indurated edges was found on the left side As the suture of the perforation only tended to increase its size, exteriorization was carried out, and the patient made a good recovery, an artificial anus being left Attention is drawn to the rarity of this type of perforation A similar case is described in which an ulcer of the transverse colon actually perforated during laparotomy

258 Arthroplasty in the Lower Extremity

S Kleinberg (*Arch Surg*, Chicago, June, 1937, p 1072) describes arthroplasty as an operation designed to re-establish a useful range of movement in an ankylosed joint or to increase the mobility of a joint with restricted function The patient should be between the ages of 20 and 45, his general condition must be good, with no active focus of infection in any part of the body he should follow a sedentary occupation, and he should be able to spend sufficient time and money for arthroplasty to be carried out successfully In performing this operation enough bone should be removed to allow easy gliding of the articular ends, the articular surfaces should be smooth and fit fairly accurately The capsule of the joint should only be stripped enough to give satisfactory exposure of the bones Arthroplasty should not be performed on a greatly deformed limb, and it is essential that the patient's circulation be good If, therefore, there is a marked deformity, extensive scarring, or loss of bone or muscle tissue, appropriate corrective treatment should be tried before arthroplasty is undertaken Pre-operative massage and voluntary contraction of the peri articular muscles are useful for building up the muscle tone necessary for good post-operative function The most favourable cases are those in which complete ankylosis has followed trauma, such as fracture, or either gonorrhoeal or pyogenic suppurative infection The most unfavourable cases are those with rheumatoid arthritis, while eburnation of bone, extensive loss of bone or scarring and fibrosis of the muscles are contraindications In cases of ankylosed healed tuberculous joints arthroplasty may be successful, but there is a danger of lighting up a latent infection For patients with hypertrophic osteoarthritis of the hip an arthroplasty or a reconstruction with arthroplasty gives unusually good results The operative technique is fully described and three cases are reported

259 Posterior Subacromial Dislocation of the Humerus

M A Thomas (*Amer J Roentgen* June, 1937, p 767) reports seven cases of posterior subacromial dislocation of the humerus, a condition that is comparatively rare and often complicated by fracture of the neck or head of the humerus Both dislocation and fracture may occur during epileptic or other convulsive seizures and are due to muscular strain A large proportion of the cases are not recognized until months after the injury In cases in which the dislocation is not reduced a new glenoid fossa may form on the posterior aspect of the scapula, and absorption of the head and neck of the humerus opposite the posterior edge of the glenoid may take place In such cases the author has noted a surprisingly good functional recovery The possibility of posterior subacromial dislocation should always be kept in mind when examining a shoulder-joint for evidence of injury, as the diagnosis may be missed at a perfunctory stereoscopic x-ray examination

260 Surgery of the Pericardium

M Behrend and R S Boles (*J Amer med Ass* June 5, 1937 p 1941) draw attention to the subject of pericarditis and to the fact that operative treatment is usually carried out too late to afford any relief Necropsy has shown that the condition remains undiagnosed more often than does any other disease Pericarditis is seldom a primary process but it often develops as the result of rheumatic heart disease, chorea or cardiac infarction, and it may be a complication of an infectious disease such as pneumonia, scarlet fever, tuberculosis, or septicaemia It may also develop in cases of empyema, chronic nephritis, and uraemia, and it may be associated with chronic inflammation of the pleura and peritoneum Inflammation of the pericardium results in a fibrinous serofibrinous, or purulent exudate within the pericardial sac Owing to the lack of symptoms acute pericarditis is often overlooked particularly in the early stages when the symptoms of the primary disease are predominant Precordial pain may be absent, but in the fibrinous stage a certain diagnosis can be made if the characteristic to and fro friction is audible, particularly to the left of the sternum in the fourth and fifth interspaces The rub appears to be near to the surface and corresponds closely to the systole and diastole of the heart Once a friction rub has been heard an x-ray examination for effusion should be carried out If pus is present immediate pericardiotomy is advisable In chronic adherent pericarditis evidence of venous congestion is shown by increased venous pressure, engorgement of the cervical veins, and enlargement of the liver and spleen and ascites Five cases are described which illustrate the necessity for prompt radical drainage in suppurative pericarditis for non surgical intervention in tuberculous pericarditis, and for earlier operation in chronic mediastinopericarditis

Therapeutics

261 Urotropine and Camphor Injections

G Cabanie (*J Urol med-chir* May, 1937, p 393) has found that intravenous injections of large doses of urotropine and camphor are of considerable value in treating severe cases of infections of the urinary tract The solution used consisted of 7·44 grammes of hexamethylene tetramine, and 0·96 gramme of camphor One ampoule of 20 c cm contained approximately 8 grammes of hexamethylene tetramine The initial dose injected for inten

sive treatment was 20 c.cm. occasionally followed by 40 c.cm. on the second day and if necessary 60 c.cm. on the third day, and one or two further doses of 20 c.cm. were injected every second to every fifth day if improvement had not taken place. It was generally found that a total of 80 c.cm. of the solution was sufficient in most cases. Usually the injections were well tolerated, although the patient often felt a slight burning sensation, and there was one case of frequency of micturition after each injection. Improvement was seen even when renal calculi were present, and in one instance the increase of ureteral peristalsis produced by the urotropine was sufficient to cause the expulsion of several small stones. Urotropine and camphor was found to be of value both before and after operation in cases of vesico-vaginal fistulæ, and as a sterilizing agent in non-specific urinary infections. This method of treatment, however, is considered to be of too drastic a nature to be advisable for any but severe cases.

262 Autogenous Vaccine Therapy

H. Reiss (*Derm. Wschr.*, July 2, 1937, p. 981) describes his experience with vaccines prepared directly from the pus in cases of pyodermia and of complications of pyodermia. The pyodermia cases included furunculosis, purulent infection of the axillary sweat glands, sycosis, acne follicularis, cellulitis, acne vulgaris, and impetigo. The gonorrhœal complications consisted of epididymitis, prostatitis, and arthritis. The author also treated a case of soft chancre by the same method. The vaccine was prepared directly from the pus. The live micro-organisms were destroyed through the addition of oxyquinoline sulphonic acid in the form of proside (vatren 105). The author describes in detail the preparation of the vaccine and the doses given. Altogether he treated 250 cases and claims to have obtained good results.

263 Purpura Hæmorrhagica

C. G. Verbooy (*Nederl. Tijdschr. Geneesk.*, August 1, 1937, p. 3900) records four illustrative cases in patients aged from 52 to 74 years that intravenous injection of vitamin C in cases of thrombocytopenic purpura had no immediate success, whereas injections of liver extract or oral administration of liver caused a very rapid cessation of the hæmorrhage. In one case fresh bone marrow in doses of 2 to 2½ ounces daily for a month had a well-marked therapeutic effect. In the other two cases intravenous injection and even oral administration of calcium salts were sufficient to check the hæmorrhage.

264 Measles Prophylaxis

M. Stuart (*Arch. Inst. Pasteur Tunis*, June 1937, p. 266) attempted to control an epidemic of measles in a boarding school by the method of instilling convalescent serum into the eyes of contacts. In five days fifteen pupils were attacked by measles, and an attempt was made to immunize the remaining twenty-four whose ages ranged from 7 to 14 years, and who apparently had not previously had the disease. The serum used was taken from a child who had been convalescent for two days. Phenol in a solution of 5 parts per 1000 was added, and the serum kept at 0° C. Instillations were made three times a day, one drop in each eye, and they were continued for ten days. Eleven of the twenty-four children developed measles within eight days of starting the instillations. Probably they were all in the incubation period when the treatment was begun. The disease in the eleven partially immunized children was mild. The pre-eruptive period did not exceed one day, and the eruption was normal, although the temperature was not raised for more than two days. There was no photophobia or irritating cough, and no complications. The value of the experiment is weakened by the fact that there was no control group.

Laryngology

265 Intrinsic Laryngeal Cancer

I. Holt Diccii (*J. Laryng.*, July 1937, p. 463) contrasts the results obtained by laryngofissure and surgical excision with those obtained by radiation by the Finzi-Harmer technique. This review is restricted to the type of case suitable for either procedure. Between the years 1931 and 1935 inclusive twenty-six patients were treated by the radiation method, and for purposes of comparison the author adopts a three-year symptom-free rate. Among the twenty-six patients eighteen cases came under this heading, but in four of the eighteen there was recurrence or continuance of the malignancy. In the group treated by laryngofissure and excision of the tumour there were twenty-eight cases. From the figures it appears that treatment by the Finzi-Harmer method of radiation gives a lower operative mortality with a greater rate of recurrence or persistence of the disease as compared with treatment by laryngofissure. The convalescence following laryngofissure is quicker than that following Finzi-Harmer radiation. This is due to the more controllable dilatation of the radiation at times involving the opposite unaffected side of the larynx.

266 Anosmia of the Nose

Pierre Fidel Bertrand (*Arch. Otol.*, xxvi, May 1937, p. 733) discusses a case of anosmia from disease of the left nasal cavity. The main symptoms were nasal obstruction and repeated attacks of severe epistaxis. Operation was performed by using the external ethmoidal route. The nasal cavity was opened at the point of junction of the nasal process of the maxilla with the nasal bone, and the frontal process of the maxilla was also affected. The fragments removed resembled ordinary mucous polypi except for a small area where there was a thick dark-coloured mass. On section this was found to show the structure of an angioma. The question arose as to whether the condition should be considered as an angiomatous transformation of ordinary mucous polypi or whether the tumour was a true angioma from the start with secondary polypoid changes. The authors conclude that cavernous angiomata and so-called angiomatous polypi are neoplasms of the same nature.

Obstetrics and Gynæcology

267 Unilateral and Bilateral Oophorectomy

H. Kahn (*Mschr. Geburtsh. Gynäk.*, July 2, 1937, p. 1083) points out that it is not always easy to decide whether one or both ovaries should be removed in the case of ovarian tumours. This is especially so when operating on young women or when tumours are encountered the exact nature of which is doubtful. The decision largely depends on the pathological anatomy of the tumour and on whether it occurs singly or bilaterally. Bilateral benign and malignant tumours can only be accounted for by an increased tendency of both ovaries to tumour formation. Metastases in the second ovary from a primary malignant growth in the first are rare, but they may occur (1) by direct implantation, (2) by way of the tubes, and (3) by retrograde lymphatic channels. In every oophorectomy after incision the author advocates the examination of the other ovary. Benign ovarian tumours usually tend to be unilateral, and they rarely undergo malignant degeneration. A second operation, if required, carries no worse prognosis than did the first. The uterus should only be removed when technical difficulties demand it. Conservatism accounts for 20 per cent. of all ovarian tumours, and on account of the tendency to bilateral occurrence it requires the radical removal of ovaries, tubes, and uterus. Teratomata of the ovary are benign, and can be shelled

out, leaving enough ovarian tissue for physiological purposes Teratoblastomata, on the other hand, are very malignant and require radical operation

268 Interstitial Tubal Pregnancies

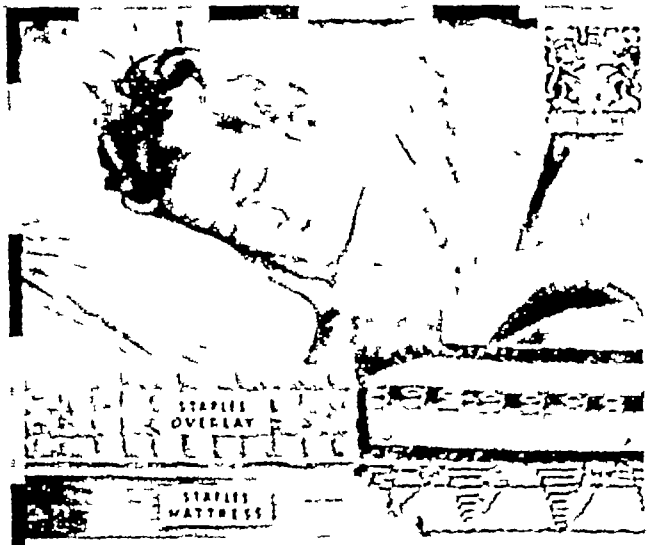
TH PUTZ (*Zbl Gynäk*, July 24, 1937, p 1747) describes eight cases of interstitial tubal pregnancies in five of which perforation occurred during the first or second month of pregnancy In two cases of three-months old pregnancies the author was able to operate just before the perforation took place, and in one case of a four-months-old pregnancy there occurred a uterine abortion Implantation in the lateral third of the tube particularly predisposes to early perforation The pregnancy may continue longer in cases of implantation in the lateral wall of the uterus or in the fundus The aetiology of the interstitial pregnancy varies Occasionally perimetric and perisalpingitic adhesions were found at operation Most patients were multiparae or had one or more abortions The clinical diagnosis is not easy but, once made, immediate laparotomy is indicated In two cases the author had to perform a supravaginal amputation of the uterus In six cases it was sufficient to carry out a wedge shaped excision of the affected uterine segment and to remove the corresponding tube

269 Creation of an Artificial Vagina

G CRISTEA (*Gynec si Obstet* April–June, 1937 p 13) describes his modification of Schubert's method of forming an artificial vagina The operation is performed in two stages, the first of which consists in the formation of a communication between the rectum and the vaginal vestibule by pushing forward the recto vaginal septum and incising it transversely The edge of the musculo-mucous wall of the rectum is then sutured to the edge of the mucous membrane of the vaginal entrance A drainage tube is inserted into the fistula thus formed and left for from three to four days Three or four weeks later the second stage is carried out under spinal anaesthesia The sacrum and coccyx are resected and the distal end of the rectum is sutured to the anal sphincter Both the immediate and end results of the operation have been excellent

270 Surgical Complications of Pregnancy

W J DIECKMANN (*Surgery* July, 1937, p 71) points out the alterations which take place in the female anatomy and physiology during pregnancy and which render the diagnosis of any surgical complication difficult There is a physiologic hypertrophy of the thyroid gland during pregnancy which may make the gland palpable, and the basal metabolic rate may reach plus 15 to 20 per cent Changes in the blood include a rapid rate of sedimentation of the erythrocytes slight leucocytosis, and changes in the serum electrolyte concentration Vomiting, which often occurs during the first trimester of pregnancy, may be due to some surgical condition such as appendicitis, gastric or duodenal ulcer, intestinal obstruction, and cholecystitis As the pregnant uterus displaces and finally covers the appendix and caecum the diagnosis of appendicitis may be difficult In the early months of pregnancy there may be pain in the adnexal regions radiating down the leg, and a false diagnosis of chronic pelvic infection may be made and laparotomy carried out Between the third and sixth months pain may be felt in the lower quadrants of the abdomen, and may suggest pyelitis, ureteral stone, ovarian tumour with a twisted pedicle or appendicitis The pain usually disappears after a few days Details are given of a series of sixty-two patients thirty of whom required major operative treatment during pregnancy ten during the puerperium, and twenty-two in addition to Caesarean section The largest number of operations were for the removal of fibromyomata when their size and location indicated that pressure symptoms would arise or acute degeneration or torsion of the pedicle take place Myomectomy caused abortion in 33 per cent of cases owing to manipulation of the uterus In eight instances an ovarian cyst was removed and nine of the patients went to term In this connexion, owing to the danger of infection or twisting of the pedicle, early removal is necessary Thyroidectomy is advised when the patient is seen before the twenty-fourth week and has a marked hyperthyroidism, this was carried out before delivery in six cases and after delivery in a further three who had been given medical treatment during pregnancy Other surgical procedures included the removal of dermoid and parovarian cysts, appendicectomy, radical cure of a ventral hernia, jejunostomy, and the treatment of carcinoma of the cervix and cholelithiasis There were only three deaths in the series



Pathology

271 Identification of B dysenteriae by Bacteriophage

A A MILLER (*Ann Inst Pasteur* June 10, 1937, p 709) has shown that a sufficiently active bacteriophage, specific for the essential types of the dysenteric group, can be used for the rapid identification of Shiga, Flexner, Hiss, and Strong types, and to define atypical strains Inoculation of doubtful primary cultures of suspected faeces on Endo's medium are made in two tubes containing from 3 to 4 c cm of peptone broth, to one of which 0 5 c cm of bacteriophage has been added Absence of growth in the latter tube with cloudiness in the control tube after five to twelve hours' incubation is in favour of a dysenteric strain Partial lysis is indicated by a cloudiness which is less intense in the presence of the bacteriophage than in the control Lysis was found in 91 5 per cent of 294 typical dysenteric cultures and in 0 08 per cent of non-dysenteric cultures About half of the phage-resistant strains were isolated together with non-resistant strains so that the margin of error was reduced Lysis was found in 15 5 per cent of non-agglutinating dysenteric strains in 66 7 per cent of biochemically atypical strains, in 52 per cent of Schmitz-Stutzer and metadysenteric strains and in 8 5 per cent of Morgan-Dahlem strains There was no difference in the results obtained by using fresh and laboratory cultures

272 Calcium Absorption

J C AUB, D M. TIBBETTS and R MCLEAN (*J Nutrit* June, 1937, p 635) have studied the calcium balance in normal humans with and without injections of parathyroid extract and in cases of parathyroid and thyroid disorders They have also investigated the effects on the calcium balance of urea, fat, salt and agar ingestion, and of constipation and catharsis In cases in which the calcium intake was low neither parathyroid extract injections nor the presence of a parathyroid adenoma caused an increase in faecal calcium In two cases of parathyroid adenoma there was better absorption of calcium during the hyperparathyroid state than after operation, while in a third case the opposite was found These results suggest that parathyroid activity has little effect on calcium absorption In normal cases and in those of hyperparathyroidism and hyperthyroidism the ingestion of urea had practically no effect on calcium absorption, but it increased urinary calcium excretion, and except in normal cases caused a slight increase in serum calcium In two normal subjects given a controlled diet, a high sodium chloride intake, a high fat intake, and the faecal volume, whether varied by constipation cartharsis or agar ingestion, had only negligible effects on faecal calcium and phosphorus Calcium absorption and excretion in the faeces appeared to be stable and independent of the factors tested, although there was evidence of some unknown factor which greatly increased calcium absorption

THE 2 IN 1 TONIC

MINERALS *PLUS* VITAMINS A & D

Syrup Minadex contains calcium glycerophosphate, potassium iodide, manganese lactate, iron and strychnine with vitamins A and D. Dose: adult 1 teaspoonful 3 times per day; child (according to age) 1/2 to 1 teaspoonful. Bottles 3/6, 5/3 and 8/6. Obtainable at chemists or from the distributors.

TO EXPEDITE CONVALESCENCE

In febrile illness and post-operative conditions the final stages of the case history can be shortened by Syrup Minadex. This modern reconstructive tonic has been carefully designed to supply those elements that illness may have deleted from the patient's system.

Minadex provides minerals—iron to regenerate the blood, calcium and phosphorus to restore neuro-muscular tone. Vitamins A and D are included to bring back resistance and to promote well-being. Syrup Minadex can be prescribed with confidence and perfect safety for children and adults alike. Its unusually attractive flavour appeals to children especially.

WHITHER DEAF AIDS?

Two years ago deaf aids were regarded with suspicion by practically every member of the Medical Profession Today valve amplifier hearing aids are being recommended even in the early stages of deafness to relieve strain and to retain the mental appreciation of sound

This revolution of ideas has been brought about by the development of the midget valve and the piezo electric crystal microphone making possible the construction of high fidelity valve amplifier hearing aids of convenient size and free from inherent noise

The reports of the various medical bodies investigating hearing aids and the striking results achieved show that the future unquestionably belongs to this type of hearing aid

Particulars of the Amplivox High Fidelity hearing aids will gladly be sent on application to —

The relative sizes of midget deaf aid valves and the present day wireless valve can be judged from this photograph in which the one is superimposed on the other

Socks of character

It is an interesting fact that the wool used for Two Steeples No 83 Socks is of the same high grade as used for the "quality" suitings bought by the best tailors The No 83 Sock is in fact, a close relative to the English and Scottish cloths that are famous throughout the world, the only difference being in the way the yarn is spun This is to meet the technical requirements of the knitting machine as distinct from the weaving loom

Your hosier will be pleased to show you this sock, made in a shade for every suit. Sizes 8½ to 12" 4/6 per pair

PROSTATIC ENLARGEMENT

AND URINARY DISORDERS OF PROSTATIC ORIGIN

Urinary retention is due naturally in the first place to the enlargement of the gland but both the congestive and spasmodic factors can in themselves cause as much obstruction as the simple enlargement.

The progress of adenomatous enlargement is slow yet the symptoms of urinary disorder polyuria difficulty and retention are subject to fluctuations in their intensity.

SEDOPROSTYL is a preparation which embraces all three causes of urinary obstruction and the fact that the aim of those Urologists who devised SEDOPROSTYL has been achieved is amply testified by the many excellent results now placed to the credit of SEDOPROSTYL

of senior assistant for maternity and child welfare at an earlier date Her share in the development of maternity and child welfare work was due as much to personal qualities which enabled her to elicit the enthusiasm of her helpers both professional and lay, as to organizing ability in the ordinary sense, but on several occasions she was called upon to address conferences in London on her special subjects As deputy M O.H she was also in charge of mental deficiency throughout the county, and was normally entrusted with the confidential inquiries into cases of maternal mortality which sometimes call for so much tact She had been a member of the British Medical Association since 1906 Her death is mourned by a very wide circle of friends in all ranks of life her relations with many of whom, while arising in the first instance out of professional contact, had become of a much more personal character

Medico-Legal

CLAIM AGAINST A MEDICAL MAN

In medical practice unusual cases often come in batches Mr Justice Tucker s first case on his appointment was the action against Mr Winsbury-White His second was a semi medical case about an oyster alleged to have been infected with typhoid, and a few days after that he heard another action against a medical man A father unsuccessfully claimed damages against Dr J E Readman of Penge, alleging negligence in the treatment of his ten year old son who died of peritonitis The claim was for funeral expenses only, and was apparently made to have the question of liability settled

The parties agreed that the doctor attended the boy on October 16 1936 for minor injuries received in a motor car accident, but found him well enough to go to school next day On the evening of Saturday October 17 the boy complained of pain round the umbilicus and suffered from vomiting and constipation The father went round to the surgery on the Sunday morning and saw the doctor Thereafter the evidence of the two parties conflicted on nearly every material point. The father said that the doctor diagnosed ptomaine poisoning from his description of the symptoms and gave him some medicine to take to the boy A neighbour who went to the doctor s home with a message early on the Monday morning, said in evidence that she had asked that the doctor should call round as the little boy was much worse and that the maid had said she would tell the doctor The father said he went round to the surgery in the evening and the woman there said that the doctor still had some visits to make He denied having said that it would do if the doctor called on the Tuesday Dr Readman s version on the other hand was that when the father came to see him on the Sunday morning and told him of the boy s illness he said that he was not on duty himself but that his assistant Dr Davidson could visit the boy during the day The father said emphatically that that was not necessary He then told him to keep the boy warm, directed a suitable diet and gave him a magnesia mixture for the boy telling the father to send for him if the boy became worse so that Dr Davidson could call in He added that in any case the boy would be visited on the Monday There would have been no difficulty in Dr Davidson s calling on the Sunday if the father had wanted him to He never used the words "ptomaine poisoning but said it was possible that a meal of brawn had set up inflammation of the stomach He made a note that the boy was to be visited on Monday He was at his consulting room early on Monday morning but received no message about the boy He put down the boy s name to be visited by Dr Davidson on that day

Miss Ralph Dr Readman s dispenser said in evidence that she told the father on the Monday evening that Dr Davidson had not completed his round but would visit the boy that evening The father then said that Dr Davidson need not visit the boy that night provided that he went early on the Tuesday morning Dr Readman then she said cancelled the order for the Monday visit and entered a visit for the Tuesday *in his book informing Dr Davidson of the change* Dr Davidson saw the boy on Tuesday and Dr Readman saw him shortly afterwards and sent him to hospital The surgeon who operated on him there said that peritonitis had probably supervened about 3 a m on the Monday if Dr Readman had seen the boy on the Sunday he might have suspected appendicitis and if the operation had been performed on the Sunday the boy would have had a better chance of living. The boy died on the following Friday

The learned judge in giving judgement said that as there was a complete conflict of evidence on nearly every vital point he had to see if any light were thrown on the conflict by the contemporary documents None of these mentioned the Monday visit and the only mention of a specific request was that of Mrs Newton the neighbour The father wrote a letter of complaint to the General Medical Council on November 3 but made no reference in it to his visit to the surgery on the Monday evening When his solicitors wrote to the doctor on November 13 they did not mention the Monday evening visit The letter written by the doctor s solicitors on the other hand set out his case explicitly and stated that the father himself had prevented an earlier visit His lordship was satisfied on the whole of the evidence that the father had made nothing in the shape of an urgent request for a visit, and that Mrs. Newton had done no more than request that a call should be made on the boy during the Monday she had not given an urgent message It was clear that Mr Wright had wanted attention for his son but had had no idea of the urgency of the case He therefore dismissed the action

PARTNERS' SIGNATURE ON CERTIFICATE

An interesting point came before the Court of Appeal in a recent workmen s compensation case A workman was drawing compensation for an injury to the head and the employers, considering that he had recovered desired to stop payment. In accordance with the law they required him to submit to examination by a medical practitioner provided by them They appointed for this purpose a firm of medical partners practising under the name of Legge and Legge The firm duly returned a certificate beginning We hereby certify that we have examined (the workman on a certain date) and in our opinion he has wholly recovered" The form of certificate required by the Workmen s Compensation Act 1925 s 12 (3) begins, I hereby certify and we and our were substituted in writing. There was no suggestion that both the partners had not examined the patient The question arose whether the certificate satisfied the Act, which provides that if a medical practitioner has examined the workman and has certified that he has recovered, and a copy of the certificate together with notice has been served on the workman the employer can stop the weekly payment The county court judge took the view that this certificate was insufficient because it purported to contain the opinion of more than one doctor and was signed by a combination of persons who might be anybody but doctors In his opinion *therefore it nullified all subsequent proceedings* Sir Wilfrid Greene Master of the Rolls disagreed He saw nothing in the Act to suggest that a combined examination by two medical men would not satisfy its requirements and said that if the two partners had each signed his own signature no question could have arisen provided that both had examined the man The firm s name he considered to be merely shorthand for the two signatures The certificate would not however have been satisfactory if only one of the partners had examined the man and signed in the name of the firm for then the certificate would not say on its face which of the two or more partners had made the examination Where two or more doctors in a firm made an examination he considered it might be desirable for each one to sign individually he could not however regard this as a strict and necessary requirement. The other two Lords Justices agreed

NOW 40% CHEAPER

5 cc vial 5/-, formerly 8/6
3 x 2cc ampoules 6/6, formerly 10/6

- In the most urgent cases of pernicious anæmia 4 cc on the first and second day of treatment 4 cc should be repeated in two or three weeks' time
- In milder cases 4 or 5 cc repeated in three or four weeks
- Subsequent therapy the majority of cases will need about 2 cc. every two to four weeks

Dr F C Happold was appointed to represent the University at the eleventh International Congress on the History of Medicine, to be held in Jugoslavia in September, 1938

ROYAL COLLEGE OF SURGEONS OF ENGLAND

Annual Meeting of Fellows and Members

The annual meeting of Fellows and Members of the Royal College of Surgeons was called for November 18, but after waiting the prescribed fifteen minutes the President, Sir Cuthbert Wallace, Bt, announced that the required quorum (30) had not been obtained, and therefore a meeting could not be constituted, nor could any resolution be moved He spoke to those present, however, on a few matters in the general annual report

Sir Cuthbert Wallace said that primary examinations for the Fellowship would be held during the coming year in Australasia, India, and (for the first time) Egypt. The plan for oversea examinations was the most ambitious which had so far been undertaken He mentioned the alterations to the College museum, which was now again open, and the rearrangement and better equipment of the library, which had been made more comfortable for readers The outstanding event of the year had been the rebuilding of the Bernhard Baron Laboratories work on which began in January It had proved a larger undertaking than was anticipated, owing to the discovery that the old foundations of one of the main walls were defective Other matters to which he referred included the work of the research staff, the various awards, lectures, and occasions of hospitality, and the number of meetings of Council and committees (nearly a hundred during the year), which had doubled during the last decade He also drew attention to the famous picture of Henry VIII granting the Act of union to the barbers and surgeons, which had been cleaned and specially lighted and now hangs over the fireplace in the inner hall He invited remarks from members

Dr Redmond Rochf noted that the Council had approved, with the Royal College of Physicians, the appointment of examiners in medical subjects of the Incorporated Society of Chiropodists Why should the College assist the ambitions of the chiropodists to have medical knowledge? He also noted that the President and Mr Seymour Barling had been appointed to give evidence on behalf of the College to the Interdepartmental Committee on Rehabilitation after Industrial Accidents Some surgeon in general practice might, by his knowledge of the environment of the people concerned have given helpful evidence Dr Howard Stratford took exception to the too general phrase 'medical subjects as describing the examination of the chiropodists

The President said that the alternatives were to fight the chiropodists or to exercise some measure of control over them and the latter was what the two Colleges were trying to do With regard to the Interdepartmental Committee, he agreed that the general practitioner was one of the most important persons in the treatment of fractures and both the witnesses on behalf of the College would bear in mind the function of the general practitioner

Sir Bruce Bruce-Porter was precluded from moving the usual resolution calling for some representation of Members of the College on the Council, but he was allowed to make some observations He said that such a resolution had been brought forward forty six times and never once lost Why did Members go on after forty six rebuffs? Partly because they had the British characteristic of not knowing when they were beaten In 1931 the Society of Members took a poll, which showed 6,956 in favour and only 156 against It was sometimes objected that with a wider franchise a Fellow who was not of the best standard might be a very astute electioneerer, and so find his way on to the Council, but Members would not wish to elect Fellows the Fellows on the Council should be elected by those in their own category and if any Member was elected and subsequently became a Fellow he should be required to retire as a representative of Members on the Council It was also stated that the paucity of attendance at the annual meeting indicated that Members were not interested, but this was merely due to the feeling that the College was to a large extent a Fellows preserve. Finally he reminded the meeting that the day might come when the State took a far more active part in the control of medicine, and then it might not tolerate so many portals of entry to the profession If such a state of affairs arose it would surely be of great advantage to the College to have a body of Members with a real interest in its status and activities

Dr W L Gillbard secretary of the Society of Members, said that sufficient consideration had not been given to the public interest in this matter As soon as he entered general practice a Member realized the unsuitability of a great deal of his training in surgery Too much time had been spent in learning things which could only be of use to him on the assumption that he was going to be a consultant The number of Members who started general practice totally unable to use an ophthalmoscope was depressing. Such defects would never be remedied until the College ceased to deprive itself of the experience of its Members.

Dr P B Spurgin supported what had been said by the last two speakers The Members were not making any unfair request, they were merely asking for a small representation on the Council.

The President declared the proceedings closed

SOCIETY OF APOTHECARIES OF LONDON

Gillson Scholarship in Pathology

The Gillson Scholarship is awarded for the encouragement of original research in any branch of pathology, and is open to candidates under 35 years of age who (*a*) are either licentiates or freemen of the Society, or (*b*) obtain the licence or the freedom within six months of election to the Scholarship The Scholarship is of the annual value of not less than 100 guineas It is tenable for one year the holder being eligible for re-election under conditions laid down in the regulations, the maximum tenure is three years The Scholarship is awarded in January and applications must be in the hands of the adjudicators by December 1 Full regulations and conditions can be obtained from the Registrar's Office, Apothecaries Hall Water Lane E.C 4

The following candidates have been approved at the examination indicated

PROSTATIC ENLARGEMENT

& URINARY DISORDERS OF PROSTATIC ORIGIN

Urinary retention is due, in the first place, to the enlargement of the gland but both the congestive and spasmodic factors must be taken into consideration, as they, in themselves can cause as much obstruction as the simple enlargement.

The progress of adenomatous enlargement is slow, yet the symptoms of urinary disorder, frequency, difficulty and retention, show no constant relationship between the increase in the size of the gland and the phenomena of retention

SEDOPROSTYL is a preparation which embraces all three causes of obstruction, and the many excellent results now placed to the credit of SEDOPROSTYL have amply repaid the work of those Urologists who devised the formula

Medical Notes in Parliament

In the House of Lords on November 23 the Expiring Laws Continuance Bill passed through Committee

The Health and Housing Committee of Conservative M P.s was addressed on November 17 by Dr W G Savage lately county medical officer of health for Somerset and by Mr Ben Davies of United Dairies Ltd Both agreed that efficient, controlled pasteurization was the only guarantee, in present circumstances for a safe milk supply They afterwards replied to many questions by members representing agricultural constituencies

The House of Commons read the Coal Bill a second time on November 23 A motion about malnutrition was down for discussion on November 24 and the Committee stage of the Air Raid Precautions Bill on the following day

The National Health Insurance (Juvenile Contributors and Young Persons) Bill was read a third time by the House of Commons without debate on November 23

The annual meeting of the general committee of the Parliamentary Science Committee was held on Tuesday November 23 at the House of Commons the Earl of Dudley (president) in the chair It was stated that the committee had submitted a memorandum to the Lord President of the Council urging a scheme for the development and financing of scientific research Correspondence is proceeding on this matter The officers for the ensuing year include president Earl of Dudley vice president Sir Arnold Wilson chairman, Professor J Graham Kerr

Inquiry into Typhoid Outbreak at Croydon

Sir KINGSLEY WOOD stated on November 18 that he had heard of the outbreak of typhoid in the Croydon district with great regret and had directed his officers to visit the town immediately with a view to co-operating with the officials of the council The result was that effective steps were at once taken to safeguard the position as regards the water supply He had informed the council that he proposed to direct a public inquiry into all the circumstances of the epidemic The inquiry would be held by a man of legal qualifications assisted by a medical man and an engineering expert

Mr DAY asked why a warning was not given to the inhabitants as soon as pollution was known to the medical officer Sir KINGSLEY said that matter would doubtless be brought before the inquiry

On November 22 Sir KINGSLEY WOOD announced the personnel and terms of reference of the inquiry It will be held by Mr H L. Murphy K C. who will have as assessors *Sir Humphry Rolleston Bt M D* and *Mr H J F Gourley* M Inst C E The purpose of this inquiry is to examine the causes leading up to the outbreak in Croydon and the steps taken to deal with it. The inquiry will begin at an early date

Insurance Practitioners' Postgraduate Courses

Sir KINGSLEY WOOD told Sir Robert Rankin on November 11 that payments in respect of fees and expenses incurred by insurance doctors in attending approved postgraduate courses would be made out of the unclaimed proceeds of sales of national health insurance stamps with the aid of the normal Exchequer grant He added that he had received no complaints from insurance committees as to the source from which the courses were to be financed Certain administrative questions were under discussion with the National Association of Insurance Committees

Gas Attack Preventive Measures

The House of Commons discussed the Air Raid Precautions Bill on November 15 and 16 Moving its second reading, Sir SAMUEL HOARE said the Government would in a short time have a supply of gas masks sufficient to distribute to the whole population. The Government intended also to supply local authorities and their decontamination organizations with bleaching powder The householder would be instructed how to act in the event of a gas raid and how to make one of his rooms gas proof The same precautions would be taken against mustard gas There would also be precautions against fires caused by incendiary bombs

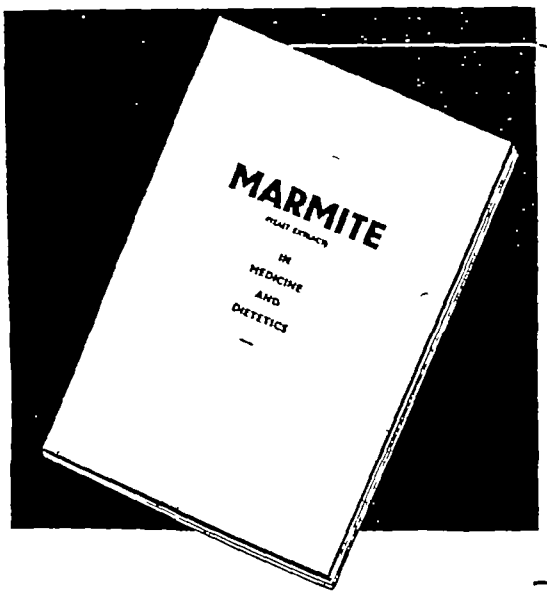
Dr HADEN GUEST said that in many parts of London the houses could not be made gas proof He thought that every local authority would have to face in consequence of this Bill increases in the staffs of hospitals and other institutions Every local authority controlling hospitals had to prepare a plan showing which hospitals could be used as casualty clearance stations which as base hospitals and which institutions such as public assistance institutions fever hospitals mental hospitals etc could be cleared of their inhabitants and used as base hospitals People in the streets might be contaminated by mustard gas and unless they had their clothing removed within fifteen minutes and decontaminated and had the mustard gas removed from their skin within five minutes every one of them would require hospital treatment and it would put the hospitals to a terrible strain

The Bill was read a second time by 324 to 135

Medical Referees and Workmen s Compensation

Mr JOHN JONES in the House of Commons on November 19 moved the second reading of the Workmen s Compensation Bill, which he said among other purposes, proposed an alteration in the system whereby a workman meeting with an accident had at present if there was any dispute as to his disability to accept the verdict of one medical referee The Labour Party did not say that these gentlemen were unfair or prejudiced but asked that instead of one person having power over the victims of accidents a Board should be established as during the war when medical boards were set up to do similar work in connexion with the Army and Navy

Mr ARTHUR HENDERSON in seconding the motion said medical referees were men of standing in the medical profession and no one on the Opposition side of the House sought to cast any reflection upon the individual referee Nevertheless some of the questions which the referee had to decide such as suitability for employment were so important that the proposal was that they should be submitted to a medical board of three doctors



Mr LYONS moved the rejection of the Bill

Sir ARNOLD WILSON said a legal chairman with two medical assessors would be a better medical board than three doctors however skilled Mr BULL considered the existing provisions as to medical examination of workmen needed simplification and the removal of technicalities resulting from the decisions of the court and the regulations which had been made on this subject but it would be hopeless to deal with the question piecemeal The regulations for medical referees issued in 1932 contained forty six different rules some of many clauses and the whole question required to be gone into

Mr FLEMING said that it was extremely difficult for the workman to succeed as a malingerer against the medical evidence On the other hand he had time and again seen cases in which medical evidence compelled the judge to say a man was fit for light duty when to laymen he appeared palpably unfit for any duty at all When a medical assessor sat with the judge the judge undoubtedly had the final word in court. There was a tendency to have cases of compensation dealt with in that manner

Mr CASSELLS said he knew of many instances of medical referees who when they were not acting in that capacity were actually called upon by insurance companies to examine workmen on behalf of the employers If a medical man had been in the habit of examining workmen on behalf of the employers he acquired quite honestly the employer s complex.

Mr GEOFFREY LLOYD said the power of a single man under the present system was great, and possibly some alternative course ought to be worked out but he asked ought that

alternative to be a medical board? A good deal could be said for keeping the medical referees but having an appeal tribunal The majority of cases were simple, and a medical referee was competent to deal with them The best thing might be an improved system of referees with a larger number of specialists in the service and with appeals allowed to a tribunal It was better to keep these matters in the hands of the medical profession so far as the purely medical issue was concerned Referring to the treatment of fractures, he said Sir Robert Jones during the war had developed the idea that there should be minimum immobilization of the injured limb That idea had been allowed rather to lapse in the treatment of industrial cases but was coming back and the results were striking Just as important was the treatment of the men when they left hospital Much could be done by more careful provision of suitable light work In future there might be reconditioning clinics for the men when they left the hospital These ideas were being investigated by two of the strongest committees ever set up by the Home Office When the reports of these committees were received the Government would consider as early as possible any recommendations for amendment of the Acts and if they accepted those recommendations would take steps to introduce legislation to implement them

The Bill was defeated by 205 to 141

Lanarkshire Practitioners and Scottish Maternity Services

Dr ELLIOT told Mr Chapman on November 22 that he had received a resolution passed by the Lanarkshire Division of the British Medical Association wherein the medical practitioners of Lanarkshire regretted that they could not accept service under the Maternity Services (Scotland) Act, 1937 Local associations of practitioners in Lanarkshire and certain other districts of Scotland had expressed their dissatisfaction with the terms of remuneration which the Department of Health for Scotland, after consultation and in agreement with the Scottish Committee of the British Medical Association, suggested to local authorities as a suitable basis of arrangements with practitioners for medical services rendered by them under this Act The Scottish Committee of the British Medical Association had summoned a representative meeting of their constituents, to be held on December 16, to consider the matter further

Periodical Nutrition Surveys of School Children—Asked by Mr Leonard on November 11 to have an inquiry made into the Oslo breakfast, which had beneficial results on the well-being of school children in Oslo, Mr KENNETH LINDSAY said the claims made for this meal had been considered by the Advisory Committee on Nutrition appointed by the Minister of Health While the value of the experiment was recognized, its adoption in this country would be open to practical objections There were other equally good and convenient methods of supplementing the home diets of children found to be in need of additional nourishment The Board of Education suggested that local education authorities would do well to consider the advisability of holding periodical nutrition surveys at which all children not receiving meals would be passed under review A number of authorities had acted in accordance with this suggestion The Board proposes to review the position in other areas to secure a general improvement in the discovery of under nourished children

Leper Accommodation in Great Britain—Sir THOMAS MOORE asked, on November 11, whether out of the sixty known lepers in Great Britain only twelve received treatment in homes suited for that purpose and if Sir Kingsley Wood proposed any action to remedy this Sir KINGSLEY WOOD answered that in the conditions existing in this country the disease was unlikely to be conveyed from one person to another, and no action would appear to be called for in the interest of the public health

Medical Certificates in Unemployment Assistance—Mr ERNEST BROWN stated on November 11 on the authority of the Unemployment Assistance Board, that there was no invariable practice of requiring a medical certificate as a condition of increasing an allowance for the purpose of providing extra nourishment. Where a doctor certified that his patient was in need of extra or special food as distinct from medicine or drugs the Board's allowance was usually adjusted to meet any extra outlay by the applicant in obtaining such food The furnishing of the certificate was regarded as part of the medical service rendered by the doctor, any payment for which fell outside the Board s powers

Old Buildings used for Nursing Homes—Dr LEECH on November 18, asked Sir Kingsley Wood to invite the local authorities concerned, either by scheduling a slum-demolition scheme or by stricter and closer supervision, to prevent more worn out lodging houses and old residences being converted into private nursing homes in the area between Harley Street and Baker Street, Marylebone Dr Leech asserted that modernization of such buildings did not render them completely sanitary or provide for a sufficient circulation of fresh air, or make them structurally suitable in surgical cases where quiet for patients and comfortable accommodation for the nursing staff and a proper distance from kitchen annoyances were essential, nor provide means for the easy removal of patients in case of fire other than by the dangerous use of outside ladders and iron staircases Sir KINGSLEY WOOD in reply, pointed out that the London County Council had power to refuse an application for registration in respect of a nursing home if satisfied that the situation, construction, accommodation, staffing or equipment of the premises rendered them unfit to be used as a nursing home He had no information that this power was not adequately exercised, but he had asked the County Council for their observations.

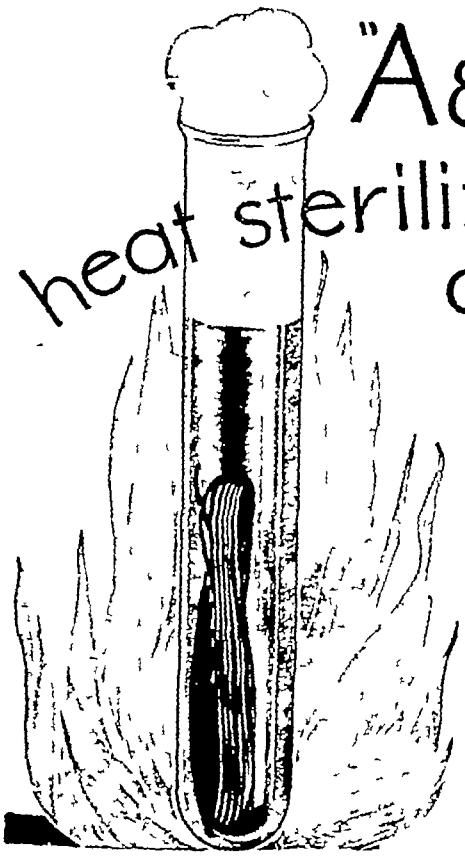
Water Supply in Denbighshire—Sir HENRY MORRIS JONES, on November 18, asked whether the attention of the Minister of Health had been drawn to the insanitary state of the water supply at Kinmel Bay, in the county of Denbigh Sir KINGSLEY WOOD said in reply that the urban district council of Abergele informed him that their medical officer of health was not prepared to advise them that the condition of the water was such as to be injurious to health Rhyl Urban District Council would be prepared to give a direct supply

The Services

HONORARY SURGEON TO THE KING

The King has approved the appointment of Major General G G Tabuteau, D S O late R A M C as Honorary Surgeon to the King, in succession to Major General D S Skelton C B, D S O, late R A M C, who has retired

EFFICIENCY DECORATION



The King has conferred the Efficiency Decoration of the Territorial Army upon Colonel E M Cowell, D S O., and Lieutenant Colonel E Scott D S O, under the terms of the Royal Warrant, September 23, 1930

No 14 STATIONARY HOSPITAL DINNER

The eighteenth annual dinner of the medical officers of No 14 Stationary Hospital will be held on Thursday, December 9 at the Trocadero Restaurant Piccadilly, W, at 7 15 for 7 45 p m, with Colonel C R. Evans, D S O, in the chair The price of the dinner is 12s 6d, exclusive of wines. The honorary secretaries are Major General H M Perry and Dr H. L. Tidy 39, Devonshire Place, W 1

No 29 GENERAL HOSPITAL DINNER

The eighteenth annual reunion dinner of the 29th General Hospital will take place at the Langham Hotel, Portland Place W on Saturday, December 4, at 7 15 p.m., when Lieut -Colonel S H Withers, C.M G, will preside Officers who wish to be present should communicate with Captain A. Percy Groves, Heronfield, Meadow Court Road, Leicester

MAW STEROTHERM

HOT AIR ELECTRIC AUTOMATIC STERILIZER

Patent No 427581

Maw Sterotherm Automatic Sterilizers have been installed in the London Westminster and many other Hospitals Surgeries, etc. throughout the country and are functioning with the utmost efficiency The special features of the Sterotherm ensure complete sterilization of Instruments Dressings, Oils, etc., by the Hot Air method It is the ideal unit where economy of space and outlay are essential

May we send you details or arrange a demonstration ?

SPECIAL FEATURES

- Efficient Sterilization
- Automatic regulation of temperature
- No supervision necessary while in use
- Very small current consumption
- Articles in apparatus remain sterile until required, as closure is bacteria proof
- Dressings quite dry after leaving Sterilizer
- Convenient size—length 16½ in diameter 9½ in

PRICE **£20**

QUERIES AND ANSWERS

Buccal and Lingual Ulcers

Dr HECTOR MACLEAN (Troon) writes in reply to 'Puzzled' (*Journal* September 11 p 564) I have recently had three patients all women in the prime of life complaining of very painful ulcers on the tongue gums, and insides of lips and cheeks The ulcers varied in size from that of a pinhead to that of a sixpence Each comprised an angry dull red ring enclosing a grey necrotic centre each case was swabbed and yielded a growth of *Staphylococcus viridans* in pure culture or as the predominant organism. All responded to ten 7½-grain tablets of prontosil album one being taken every two hours. The pain disappeared at once while the ulcers healed slowly

Nocturnal Twitching of Lower Limbs

'ANAEMIA writes May I suggest to Wilts" that the symptoms his patient suffers from *may* be the beginning of subacute combined degeneration of the spinal cord? I suffered from this train of symptoms for a long time before it was discovered I was suffering from pernicious anaemia This was before liver treatment was discovered I keep my blood count fairly normal by liver treatment, but at times I slip backwards the main manifestation being the return of the spasmodic movements and twitching in my legs and to some extent in my arms I also suffer from cramp in the muscles more than usual A blood examination is indicated with special reference to the size of the red cells If the size is above normal the patient will probably get up of a morning rather tired etc A hot bath *every* morning will help this condition and to some extent help the diagnosis. May I add I have seen these symptoms in some of my patients with pernicious anaemia

Incontinence of Faeces

Dr E. C DAWSON (Derby) writes in reply to A. M," who asked for suggestions for the treatment of a case of nocturnal incontinence of faeces in a girl of 18 (*Journal* November 13 p 1003) I was faced with a very similar problem some time ago in a boy aged 10 In my case however I was provided with a clue that may not be present in A. M s case—namely the consistent appearance of one or two spots of bright red blood in the mess in the bed I succeeded in ridding my patient of his complaint and benefiting from the experience of this case I would make the following suggestions The nocturnal incontinence may be due to the reflex stimulation of defaecation produced by the patient inserting a finger into the anus during her sleep Such an action may be the result of a wakeful bedtime habit that has become so regular as to be continued unconsciously in sleep, when control over defaecation is lost in the event of an unusual external stimulus The habit of inserting a finger into the anus may have been begun for one or both of two reasons (i) to relieve irritation caused perhaps by a thrombosed pile (ii) to produce erotic sensations. I suggest that a close examination be made for (*a*) a slight blood stain produced by mild trauma (*b*) suggestive creases or stains in the patient's nightwear, and (*c*) traces of faecal matter in one of the finger nails I cured my patient by making him wear thick gloves well padded with cotton wool at the finger tips when going to bed

LETTERS, NOTES, ETC.

Canti's Cancer Film

Dr RICHARD KERRY writes from Montreal What is perhaps our most valuable work on cancer Canti's film does not seem to have been exploited to the full If this could be retaken and measures (as used by the cinema photographer) applied to slow the boiling motion to about one inch a minute what a revelation we should have! A film taken with a moderately high power and re-enlarged several times should show little loss of definition and if a series could be run and contact with various chemicals and coagulants established we should have information on the local disorganization of growth which might prove in valuable as a basis of treatment

Strangulated Ovary in a Hernia in an Infant

Dr J P ZUM BUSCH (Liestal, Switzerland) writes Having read the interesting note on a case of strangulated ovary in a hernia in a child aged 3 months, published by Dr M H. Fridjohn and Mr M Lee in the *Journal* of August 7 (p 266) I beg to add a similar case in a still younger child Many years ago when surgeon to the German Hospital London I operated on a female child 10 days old admitted for strangulated inguinal hernia. The operation showed as contents of the hernial sac an ovary of bluish colour and much swollen with a twisted Fallopian tube. The child made an uninterrupted recovery Shortly afterwards I removed a huge ovarian cyst with twisted pedicle from a little girl, aged 10 years who had just arrived from South Africa The twisting of the pedicle had probably begun during the sea voyage but the condition had been mistaken for violent seasickness Both cases were published in one of the German medical weeklies (probably the *Dtsch med Wschr*) but as I cannot at present consult a medical library I am unable to give the title and the number of the periodical.

Developmental Cysts in Upper Incisor Region

Mr H T ROPER-HALL (Birmingham) writes I am grateful to the readers who have been so kind as to send me details of their cases of the above type for the paper which I am preparing As these conditions are not common I shall be glad if readers will be so kind as to help me further (1) with details of cases (2) interesting models diagrams, slides, or radiographs (3) references to the subject in the literature The cysts can be classified as (*a*) anterior retention cysts at the angle of the nose between the lip and the alveolus (*b*) fissural cysts between the teeth—median or lateral or globulo-maxillary cysts (*c*) incisive canal cysts—that is behind the incisors, (*d*) dermoid or inclusion cysts

Lister's Mother

Dr J W CRERAR writes Permit me to thank you for the admirable note in the *Journal* of November 13 (p 993) on the "Isabella Harris—Ismay" ceremonial at Maryport. In the interest of historical accuracy you may perchance like to make two small corrections Lister's mother Isabella Harris, was born on January 29 *1792* not 1782 I hold a certified copy of the registration of her birth taken from the Friends Register at Wigton Maryport does not owe its name to Mary Queen of Scots The name was given to an almost vacant piece of ground known at least from the time of Queen Elizabeth as Elnesfoot or Ellenfoot, by Humphrey Senhouse the Lord of the Manor in compliment to his wife Mary Fleming. The name Mary Port conferred by him in 1749 received statutory confirmation in the (2nd) Local Act of *1756*

MAKE THIS TEST

BEFORE YOU BUY SURGEONS' GLOVES

Inflate the end of a finger as fully as possible Then look for tell-tale rubber "drip" mark at the tip of the finger! You'll find none in *Maderite* Surgeons' Gloves, for they are uniformly thin, yet tough throughout—moulded to the hand No excess rubber anywhere, free from thickened spots or imperfections that dull your touch

The "gloveless" feel of *Maderite* brown Milled Surgeons' Gloves is further emphasized by the accuracy of their anatomical design They do not bind or resist They co-operate with every move of your hands

Try on a pair and note the secure and firm grip the roughened surface gives you on your instrument See how well *Maderite* gloves fit and feel They are made for their job and do it well Made by the manufacturers of Seamless Standard Latex Surgeons' Gloves, the famous tissue thin, quality white gloves

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

422 Prognosis of Pleurisy with Effusion

S K KALLNER (*Acta med scand* 1937, **92** 6, 549) has attempted a follow up study of the 690 cases of pleurisy with effusion treated at the Serafimer Hospital in Stockholm between 1915 and 1934 Only typical cases of so-called idiopathic exudative pleurisy in previously healthy persons were included in this study The subsequent fate of these patients was investigated between October 1935, and March, 1936 In 110 cases the ex patients could not be traced many having left the country as seamen About 25 per cent of the total were unable to present themselves for a personal examination, and information concerning them had to be obtained by correspondence. It was found that 39 per cent of the ex-patients traced had developed tuberculosis and 22 per cent. had died of it Prognosis was relatively worse for those patients in whose families tuberculosis existed, and for those who were under weight when first admitted to hospital Withdrawal of the pleural effusion did not seem to have had any great effect in preventing the subsequent development of tuberculosis but such drainage proved of much value in checking any tendency to collapse of the thorax The replacement of withdrawn fluid with air did not, in the cases examined prevent the subsequent adhesion of the pleural surfaces The prognosis was better for small than for medium sized or large effusions

423 Rheumatism and Sickness Insurance

W KREBS (*Dtsch med Wschr.*, September 24 1937, p 1485) draws attention to the confusion which exists in the nomenclature of the rheumatic diseases and to the consequent difficulties encountered in statistical analyses. Even when the same diagnostic terms are employed there are remarkable fluctuations from year to year in different parts of Germany in the numbers of persons receiving sickness benefit for rheumatic diseases Thus in Hanover there were 565 sickness insurance cases of acute articular rheumatism in 1932, and 1,531 in 1934 In Breslau in 1929 the insured cases of sciatica and other forms of neuralgia numbered 2 022, whereas in 1935 in the same town their number was down to 800 In Hamburg the duration of invalidism due to acute articular rheumatism has recently ranged from eighty-four to ninety days whereas in Hanover it has ranged from only twenty five to thirty three days After drawing attention to various other anomalies in his statistical survey of the rheumatic diseases in Germany the author compares their effects with those of tuberculosis and shows that from the sickness insurance point of view the former are almost as serious as the latter although the number of patients suffering from tuberculosis is somewhat higher than that of rheumatic patients In such a comparison the time factor is all important and it has been calculated that the duration of invalidism in Germany on account of tuberculosis was in 1935 only 5 7 years per case whereas the corresponding figure for the rheumatic diseases was 13.3 years per case

424 Swineherds Disease

S FROLM (*These Paris* 1937 No 536) who reports an illustrative case in a man aged 29 states that swineherds disease was first described by H Bouchet in 1914 in Upper Savoy and subsequently by G Penso of Rome who carried out his first investigations in France in 1933 as well as by Muller and Urech in the same year in Switzerland More recently the disease has been studied in Italy The clinical picture is characterized by three stages—namely an intestinal phase, an apyrexial period, and a meningeal stage In some cases the clinical picture is not complete There are no complications, and the prognosis is favourable Swineherds disease, belongs to the group of acute infections It is sporadic non-contagious and confers immunity from subsequent attacks in the great majority of cases It is an occupational disease affecting swineherds or those working in pig-sties The pig which suffers from an indefinite disease of the same nature is the probable source of the virus Experimentally the disease has been transmitted to man and different animals including the pig, rat, ferret, and cat. The organism has not been identified The pathogenic agent is probably a filterable virus which circulates in the blood and meninges and is excreted in the urine and faeces Direct contact with the faeces appears sufficient to explain the transmission of the disease

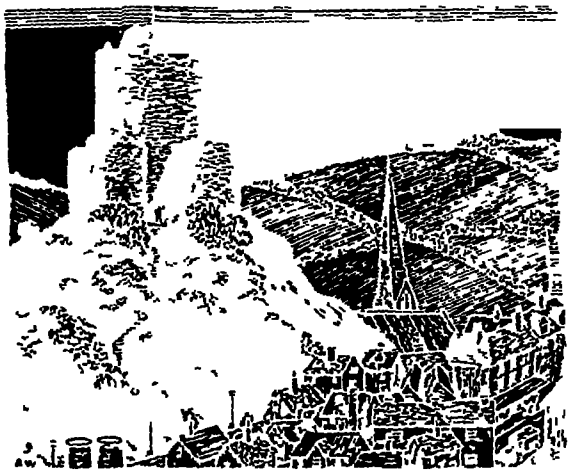
425 Food Poisoning by Staphylococci

W A TIMMERMAN (*Nederl Tijdschr Geneesk* September 18 1937 p 4443) states that in recent years staphylococci have been shown to be an occasional cause of food poisoning. The symptoms which are the same in all cases, appear two to four hours after the ingestion of infected food and consist in vomiting which may be very severe abdominal pain and diarrhoea There is sometimes severe prostration The gastro-enteritis subsides in about twenty-four hours, but the patients remain weak for a few days No fatal cases have occurred Timmerman reports a small outbreak which occurred at Utrecht as the result of eating liver sausage Staphylococci were grown from the sausage and produced in broth an enterotoxic substance which when taken by mouth produced typical symptoms of food poisoning in a human volunteer

Surgery

426 Renal Tuberculosis

J MINDER (*Z Urol.*, 1937, **31** 8 p 523) states that only two proved cases of so-called spontaneous cure of renal tuberculosis have been recorded in the literature. Proof of cure consists of clinical demonstration of cessation of subjective symptoms the disappearance of pus and of tubercle bacilli from the urine and anatomical proof of healed tuberculous foci In most recorded cases of spontaneous "cure" this has been only apparent, the tuberculous lesion having become inactive but not healed A pretuberculous stage must be assumed to account for those cases in which tuberculous foci in the kidney can be demonstrated but in which no clinical symptoms develop A tendency to spontaneous cure in some of the foci but not throughout the kidney has been abundantly proved Cases of extrarenal tuberculosis with healed renal tuberculosis cannot properly be taken into consideration for the lesion begins in the cortex and is bilateral whereas in true renal tuberculosis the lesion begins in the papillae and is unilateral Minder is of the opinion that in the presence of pyuria, tubercle bacilli in the urine and loss of function the possibility of spontaneous cure is so remote that in all cases the only effective treatment is by nephrectomy



427 Subtrochanteric Osteotomy

P INGELRANS and A VANDEUVRE (*Scalpel* Liége August 7 1937 p 1132) give the results obtained in thirty nine cases in which various lesions were treated by subtrochanteric osteotomy Twenty operations were carried out for the sequelae of coxalgia in patients between the ages of 8 and 27 The osteotomy was transverse in all but one instance

THE ABSOLUTE COMFORT and security which the Deimel Underwear affords in the most trying climate is remarked upon by all its wearers Those whose powers of resistance have been weakened by wearing unsuitable underwear derive new strength from Deimel Mesh Garments which absorb and eliminate perspiration quickly, and provide a dry climate about the body which enables the wearer to undergo extremes of heat and cold with comfort

Insist on "Thermega" It is vital that these appliances should be made by experienced manufacturers

and in five cases it was preceded by an arthrodesis of the hip In all these cases the functional result was satisfactory In two cases osteotomy was performed for coxa vara, and the end-result was good, while in another instance a malunited subtrochanteric fracture was corrected by osteotomy through the fracture There were three cases of congenital dislocation of the hip, one of these with Little's disease and spastic paraplegia had been improved by laminectomy, and a double osteotomy was carried out with a good result A double dislocation of the hip was treated by Schanz osteotomy on one side and by osteotomy after arthrodesis on the other The patient was then able to walk Osteotomy was also successful in one case of bilateral coxalgia fixed in abduction with lordosis, and in another case of chronic osteo-arthritis of the hip In nearly every instance the operation followed the technique of Kirmisson, which is described Union usually took place in about 100 days, immobilization being obtained by a plaster cast moulded to the limb after operation and extending from the pelvis to the toes The position of the limb was controlled by x-ray examination at the time of operation and at intervals subsequently

428 **Complications of Arteriography**

M P REGO (*O Hospital* Rio de Janeiro, September 1937, p 465) who records in some detail an illustrative case, states that arteriography, which was first introduced in 1927 by Egas Moniz, gives information on the following points the anatomical arrangement of the arteries, variety number, site, and shape of aneurysms, relation between the aneurysmal sac and the vessel, permeability or otherwise of the sac, arterial circulation, and arterio-venous aneurysms Arteriography should not be done indiscriminately, but is indicated in aneurysmal swellings, bony tumours, arteriovenous aneurysms, senile arteritis, Volkmann's syndrome, thrombo angiitis obliterans, and juvenile arteritis (diabetic, sypnilitic, etc), it is contra-indicated in all vasomotor diseases, in old persons, and in haemophilia thrombocytopenia, intense anaemia, cachexia, uraemia and most of all in Raynaud's disease The complications of arteriography may be classified into those due to (1) the puncture, (2) the injection, and (3) the contrast fluid Apart from the possibility of haematomata and slight ecchymoses due to defective technique, the puncture can do no harm Occasionally the injection may be made into the tissue surrounding the artery and cause intense pain and sometimes abscess formation The contrast solution may give rise to general intoxication, or to local irritation or pain Rego's patient was a man, aged 26, in whom arteriography aggravated the existing Raynaud's disease and necessitated amputation of a toe

Therapeutics

429 **Short-wave Diathermy in Whooping-cough**

K R v ROQUES (*Med Welt* September 4, 1937, p 1240) reports forty-nine cases of whooping-cough cured by means of short-wave diathermy Both chest and neck were treated at each sitting, each for about ten minutes All the forty-nine cases were cured The average duration of the treatment was about a fortnight Recurrences were treated in the same way Medicinal treatment was carried out in addition to the diathermy treatment whenever necessary

430 **Acute Mercurial Poisoning**

L MICHAUD (*Schweiz med Wschr* August 28, 1937, p 878), in discussing acute mercurial poisoning following the ingestion of bichloride or oxycyanide of mercury, stresses the importance of general treatment He advises daily subcutaneous injections of solutions of sodium chloride and sodium carbonate, while frequent estimations are made of the alkaline reserve, the chlorine and urea content of the blood and sometimes also the concentration of cations (Na, K, Ca, Mg) He uses at the same time the Strzyzovski antidote—a stable solution of sulphuretted hydrogen This antidote, however, is efficacious only when given not later than two hours after the ingestion of the poison

431 **Endocrine Treatment of Endarteritis Obliterans**

H. TEITGE (*Med Klinik* August 27, 1937, p 1153) has treated a number of cases of endarteritis obliterans and of ulcus cruris by means of sexual hormones He believes that endarteritis obliterans, which is more common in men than in women, is partly caused by endocrine imbalance and that it is favourably influenced by the administration of folliculin Ulcus cruris, which is more common in women, is, in his opinion, caused in the same way and is equally amenable to folliculin therapy Acroparesthesia caused by defective circulation of the blood in the extremities also responds very rapidly to folliculin, progynon, or any other similar preparation Good results from the same therapy have also been observed in decubitus and gangrene of the limbs in diabetes, and in Raynaud's disease

Radiology

432 **Radium Treatment of Leukaemia**

C G PARSONS (*Brit J Radiol* August, 1937, p 573) reports the results of treating sixteen cases of leukaemia with radium at the General Hospital, Birmingham Two were cases of chronic lymphatic leukaemia, the remainder of chronic myeloid leukaemia The radium was applied in large doses to the splenic area, and the patients attended for a course of treatment once a year The author does not claim better results or longer expectation of life from radium treatment as compared with x-ray treatment, but he stresses the ease and convenience of one yearly treatment, which the patients prefer to a course of x ray treatment He also maintains that unpleasant and dangerous reactions are both less severe and less frequent than with *x* rays He discusses the effect of radium on the blood picture Like *x* rays, it influences the immature pathological leucocytes to a greater degree than the normal white cells, while it relieves the anaemia at the same time The presence of severe anaemia or of a large number of nucleated red cells is a bad prognostic sign No cases resistant to the treatment have been encountered

433 **Effect of X Rays on Gliomas**

C H FRAZIER B J ALPERS E P PENDERGRASS and G W CHAMBERLIN (*Amer J Roentgen* July, 1937, p 203) have investigated thirty gliomas before and after treatment with x rays in order to determine the histological effects of irradiation for future guidance The types of irradiation were arbitrarily grouped as follows inadequate—less than 1,000 *r* units applied to the tumour moderate—1,000 to 2,000 *r* units applied to the tumour and adequate—more than 2,000 *r* units applied to the tumour Of twelve medulloblastomas five showed either a moderate or marked histological response to irradiation five showed a mild response, and two none at all The histological effects were seen primarily in the cells, next in the connective tissue stroma, and last in the vessels The medulloblastomas are radiosensitive, and they should be treated with intervals of not more than six weeks between any two series Each series should be delivered through a maximum number of skin portals Approximately 2,000 *r* units (measured in air) can be safely delivered to each portal Of seven cases of glioblastoma multiforme only four showed a mild response to irradiation The changes observed were an increase in pseudomitosis and in the number of giant cells, and a slightly

"LIVEROID" BRAND

PREPARATION OF LIVER

"LIVEROID" is a concentrated preparation of the uncoagulated juice of liver, in combination with other blood and nerve-forming substances Usefully prescribed for —

Pernicious anæmia and all forms of megalocytic anæmia characterised by high colour index.
Normocytic or secondary anæmias due to loss of blood from any cause.
Microcytic anæmias in which iron therapy combined with liver is desirable.
General debility, neurasthenia or weakness

"LIVEROID" is pleasant to take, and can be given in the form of an appetising beverage.

Literature supplied on application : **In Bottles 3/6 and 5/9**

OXO LIMITED, Thames House, Queen St. Place, London, E C 4

For use in the treatment of the **Chest** *and* **Lungs** *and surgical uses generally . . .*

"Gamgee Tissue"

REGD TRADE MARK

Made exactly according to the direction of its inventor, the late Sampson Gamgee, F R S E, Consulting Surgeon to the Queen's Hospital, Birmingham Composed of high grade cotton wool enclosed in absorbent gauze

Obtainable in three qualities from all chemists

SOLE PROPRIETORS & MANUFACTURERS ROBINSON & SONS LTD OF CHESTERFIELD & 168 OLD ST LONDON, E.C.1

PERMAHEAT

SAFETY ELECTRIC HEATING

increased fibrosis The glioblastoma multiforme group must be regarded as only slightly sensitive to irradiation The cells show a greater resistance to irradiation than do medulloblastomas The value of irradiation treatment of this tumour is questionable However, the authors suggest treating these tumours with massive doses according to Coutard s method, using four or five ports of entry The interval between the series of treatments may be slightly longer than in the case of medulloblastomas Of six astrocytomas treated two showed a moderate and one a mild histological response This was seen in a more mature appearance of the cells after irradiation, in an increase of multinucleated forms, and of fibrous and glial stroma Some astrocytomas are slightly radiosensitive They should receive thorough irradiation treatment at six or eight weeks intervals Two ependymomas responded fairly well to treatment and showed a definite tendency to increased maturity of the cells after irradiation Three oligodendrogliomas showed no response to irradiation

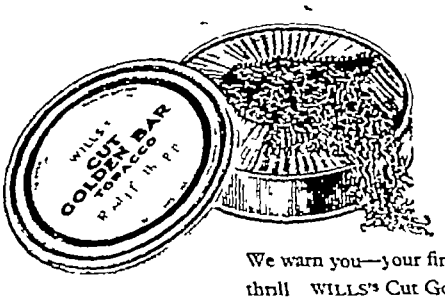
434 Pituitary Irradiation in Insulin resistant Diabetes

F RATHERY and P FROMENT (*Ann de Méd*, July, 1937, p 169) state that while total resistance to insulin in diabetes is exceptional, partial resistance is very common They record the case of a diabetic, aged 32, who was almost totally insulin resistant during ten months' daily administration of 300 units in four doses To combat the persistence of marked hyperglycaemia with acidosis, the hypophysis was irradiated on twenty occasions during six weeks (1,200 *r* in all from each of four fields) Clear evidence of an increased sensibility to insulin was eventually forthcoming, with 225 units of insulin daily sugar and acetone bodies disappeared from the urine, and the blood sugar was reduced from 3 4 to 1.2 grammes per 100 c cm Later a certain degree of insulin intolerance developed so that the dosage had to be cut down to 145 units and in spite of the general improvement hyperglycaemia (2 1 grammes) and some glycosuria persisted Irradiation of the hypophysis even in absence of radiological or clinical signs of pituitary abnormality has been tried with success in similar cases by other workers because of the amelioration produced by ablation of the pituitary (or part of it) in clinical and experimental diabetes, it is a measure calling for much prudence, and in the present case was followed by a temporary phase of increased intolerance attributed to a wave of pituitary hypersecretion

435 Radiotherapy of Climacteric Haemorrhage

The Göttingen Universitäts Frauenklinik continues its extensive use of radium or x-ray treatment for menopausal bleeding and W v MASSENBACH (*Zbl Gynäk* October 9, 1937 p 2377) states that from 1933 to 1936 of 226 women aged 40 or over admitted for hypermenorrhoea in the absence of gross organic pelvic disease, 105 received radium treatment and sixty x ray therapy curettage being the sole therapeutic measure in the remaining sixty-one patients Both varieties of radiotherapy were preceded of course by curettage Radium treatment was rejected in favour of *x* rays when the configuration of the cavum uteri was abnormal or when the least suspicion remained of local inflammatory condition after investigation which included a leucocyte count and measurement of the erythrocyte sedimentation rate only one case of pyrexia followed the intra uterine application of radium, of which the total dose was 1,800 to 2,000 milligramme-hours In general if the fragments from curetting showed a moderate or severe degree of glandulocystic hyperplasia radiotherapy was employed in women aged 40 and over Nearly three-quarters of these cases showed some degree of endometrial hyperplasia The radium dosage specified or an ovarian irradiation of 290 *r* sufficed to induce amenorrhoea ensuing at once or after one more period in nine cases out of ten Radium therapy because of its immediate haemostatic effect is preferred in patients who are gravely exsanguinated In comparing the results of radium and x ray treatment it was found that the former induced less severe symptoms of the artificial menopause (as assessed by the capacity of resuming ordinary life), but that a vaginal discharge lasting some three months was induced in about two thirds of cases, as compared with one half after x rays Only in 2 per cent of cases had a second radium application to be made

436 Encephalography

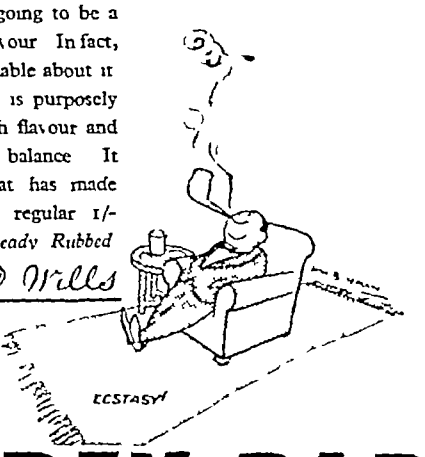


A M ABRIL and H F DE CASTRO (*Arch Med infant* April–June, 1937 p 159) discuss the applications of encephalography to the study of the chronic encephalopathies of childhood Encephalography may be of value in rendering more exact the diagnosis of such clinical entities as idiocy, imbecility epilepsy Little s disease, infantile cerebral hemiplegia, microcephaly, etc Thus idiocy may be due to chronic meningo-encephalitis or to tuberose sclerosis of the brain and infantile hemiplegia may be the result of a plastic arachnoiditis or of porencephaly—all conditions which were indistinguishable, except at necropsy before the advent of encephalography Encephalography is also of value in prognosis, and in occasional cases it has some therapeutic effect When carried out with the proper technique it would appear to be remarkably safe, unfavourable reactions being observed in less than 1 per cent of more than 800 cases Generally speaking, a reaction, including pyrexia, headache, and occasionally vomiting sets in about six hours after the operation, and lasts for twenty-four to forty-eight hours The pre-operative, operative, and radiological technique elaborated by the authors is described in detail and full reports are given of a series of cases in which diagnosis was facilitated by encephalography

437 Comparative Effects of Varying Voltages

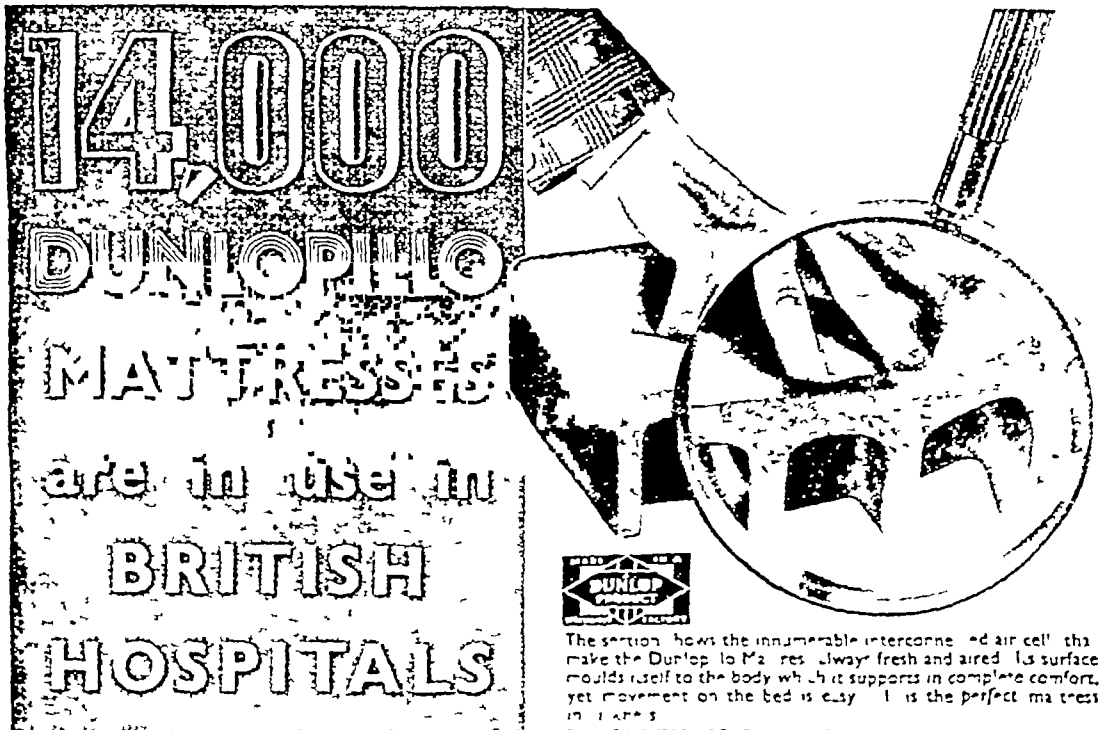
R S STONE and P G ABERSOLD (*Radiology* September 1937 p 296) compare x radiation produced at 200 and 1,000 kilovolts The monochromatic equivalent kilovoltage of the beams used is 100 and 500 respectively Comparison based on ionization measurements and skin reactions shows that the 1 000 kilovolts radiation delivers larger depth doses the dose increasing with the depth and with the decrease in size of the irradiated field In cross fire technique the large doses on the surface of the exit of the x ray beam offset somewhat the practical value of the large depth doses Supervoltage radiation can be used to greater advantage if direct cross fire can be avoided or when the parts treated are thick, as when multiple small fields can be used without excessive overlapping on the opposite skin The scattering of radiation into the tissues adjacent to the beam is less with the supervoltage radiation The isodose curves of supervoltage radiation are flatter Using the protracted fractional method of treatment the total number of *r* units that can be given with 1 000 kilovolts radiation is larger than the total number of *r* units that can be given with the 200 kilovolts radiation in the proportion of five to four

438 Tomography of the Larynx



GUNSETT and SCHNEIDER (*Bull Soc Radiol méd* Paris July 1937 p 569) recommend tomography of the larynx for the radiographic localization of laryngeal tumours as the usual lateral view of the larynx is insufficient for such a localization. The tomographic image shows whether the tumour is situated on the right or left side In cases of intrinsic carcinoma, particularly in cases of carcinoma of a vocal cord the lateral radiograph is incapable of supplying the information required by the surgeon in view of the overlapping of the region of the tumour by the thyroid cartilage The tomographic image gives precise information about the condition of the vocal cord of the ventricular band and of the ventricle on either side, as well as of the subglottic region The authors recommend the method in all cases in which a radiographic examination of the larynx is required

To the man with a sense of balance



We warn you—your first pipeful of this tobacco is *not* going to be a thrill WILLS'S Cut Golden Bar has *no* super-subtle flavour In fact, *you may even decide that there is nothing very remarkable about it* In a way, you'll be right if you do For this tobacco is purposely blended so as to avoid striking characteristics In both flavour and aroma, we have aimed at getting a perfectly natural balance It is, indeed, this very absence of "mannerisms" that has made it so amazingly popular — as the regular smoker's regular 1/- tobacco *You can get it in the Original form or Ready Rubbed*

W D & H O Wills

WILLS'S CUT GOLDEN BAR

Issued by The Imperial Tobacco Company (of Great Britain and Ireland) Limited (T.91C)

The section shows the innumerable interconnected air cells that make the Dunlop Mattress always fresh and aired Its surface moulds itself to the body which it supports in complete comfort, yet movement on the bed is easy It is the perfect mattress in health

DUNLOP RUBBER COMPANY LIMITED (Sundries Rubber Goods Department) Cambridge Street Manchester 1

Obstetrics and Gynaecology

439 Krukenberg's Ovarian Tumour

R NICOLÒ (*Pathologica* August 15, 1937, p 324) recalls that the tumour described by Krukenberg in 1896 (called by him ovarian mucous-cell fibrosarcoma carcinomatodes) is a solid, nearly always bilateral, highly malignant tumour of which the characteristic feature is the presence of signet-ring and other mucogenic cells in a sarcomatous stroma, usually of spindle cells It has since been found to be associated in the majority of cases with a carcinoma of the alimentary canal, commonly of the stomach, and many authors believe it to be in every case a metastatic tumour of which the primary source will be discovered —if necessary by taking serial sections—elsewhere Nicolò quotes those who dispute such a view, and, on the basis of two cases here described, agrees with them In the first, a clinical study of a woman, aged 37, showed no evidence of gastro-intestinal lesions, in the second, necropsy showed no sign of any other neoplasm in a woman, aged 62, who died of hepatic cirrhosis and had an extra-ovarian Krukenberg tumour in the retroperitoneal tissue near a sacro iliac joint The author concludes that some cases at any rate are due to the development of a mixed blastoma from indifferent cells of embryonic remnants, probably of the Wolffian body Such a view would explain the fact that the tumours are usually bilateral, their being confined to the female sex, their occasional occurrence behind the stomach, and their partial cellular differentiation into mucoid cells

440 A SIMECEK (*Amer J Cancer*, September, 1937, p 21) recalls that this ovarian tumour, which enlarges without distorting the organ and contains mucin-producing cells, although originally thought to be primary, is now accepted by most authors as a tumour secondary to a carcinoma elsewhere, usually in the gastro intestinal tract It is commonly bilateral, is accompanied by ascites, and is almost always fatal As an illustration of the ease with which the primary growth might be overlooked at necropsy Simecek describes the case of a woman, aged 33, who had had oedema of the labia majora for two years and crural oedema for twelve months, and died three months after the detection of abdomino-pelvic ovarian tumours Extensive metastases were present in the lungs, bone marrow, and suprarenals, all containing mucin-secreting cells of signet-ring form The primary growth, situated in the pyloric end of the stomach, was sessile, had a diameter of 2 cm only, and had not extended into the muscularis propria or serosa In this case the long-standing oedema of the external genitals and metastatic affection of the mesenteric lymph vessels and glands pointed to spread of the growth along the lymphatics, blood-stream metastasis was indicated, in addition, by embolic tumour cells in the pulmonary arteries and by the metastases in the bone marrow

441 Hystero-salpingography

C BÉCLÈRE and É FRANÇOIS (*Bull. Soc Obstét Gynéc* July, 1937, p 568) studied 110 cases of sterility by means of lipiodol injection and radiography In fifty cases (45 per cent) both Fallopian tubes were completely impervious *In twenty-one of these cases* the obstruction was due to a latent hydrosalpinx which could not be diagnosed clinically In ten cases the obstruction was at the fimbriated end of the tube and in fourteen cases at the uterine cornu In five cases the obstruction was at the cornu on one side and at the fimbriated end on the other In none of these fifty cases did pregnancy subsequently occur Thirty-two cases showed an incomplete obstruction of the tubes, in fifteen one tube was permeable and the other closed Two of these patients afterwards became pregnant. In seventeen women there was bilateral, though diminished, permeability, with one subsequent pregnancy Of twenty-eight women in whom permeability of the tubes seemed normal, seven became pregnant after the examination In twelve cases there was a uterine abnormality, in one a bifid uterus, in others the uterus was infantile or malformed In four cases spasm of the isthmus was noted Of all the cases subjected to hystero-salpingography 10 per cent became pregnant after the examination, of those whose tubes appeared normal 25 per cent became pregnant In no case was there any serious complication due to the salpingography

Pathology

442 Venous Pressure in Rarefied Atmospheres

P BERGERET LÉONARD and GIORDAN (*J Physiol Path gen* June, 1937, p 371) have studied the peripheral venous pressure in chloralosed dogs exposed to controlled low atmospheric pressures corresponding to various high altitudes, or breathing at a normal pressure air poor in oxygen Arterial pressures were measured simultaneously When air pressure was rapidly reduced to correspond to an altitude of 7,000 metres, there was a rise in arterial pressure, together with a rise of varying degree in venous pressure Rapid reduction of air pressure to correspond to an altitude of 11,000 metres (anoxaemic zone) caused a parallel and progressive rise in both arterial and venous pressures, followed by a sudden fall in arterial pressure to as low as 2 c cm of mercury, while the rise in venous pressure continued Then as air pressure was increased to correspond to a return to ground level, arterial and venous pressures were both restored to their initial levels Similar results were obtained after denervation of the carotid sinus, but occurred at pressures corresponding to altitudes of from 7,000 to 8,000 metres, and also when the air breathed had a normal pressure but an oxygen content reduced to correspond to an altitude of 14,000 metres These changes were like those seen in other forms of asphyxia at the point of cardiac and respiratory failure In general, as long as the myocardium retained its power of adjustment, falls in atmospheric pressure—increase in altitude—caused parallel changes in arterial and venous pressures, but under anoxaemic conditions, when cardiac failure with right heart stasis developed, the arterial pressure fell and the venous pressure rose

443 Anti tuberculous Immunization

L NÈGRE and J BRETEY (*Ann Inst Pasteur*, August, 1937, p 173) have investigated in baboons the immunizing action of smooth strains of tubercle bacilli isolated from human pathological material, with particular reference to the route employed for immunization Immunizing doses of smooth *Ag* and *Va* strains were given intravenously or subcutaneously, and then after an interval the immunized animals, along with unimmunized controls were injected with a test dose of virulent tubercle bacilli and killed for examination when the controls died Two baboons, given intravenously three immunizing injections of 0 01 mg, 0 1 mg, and 1 mg of smooth strain bacilli and then the test dose, showed no macroscopic lesions of the lungs, liver, spleen, or kidneys Of two baboons given a single immunizing dose of 1 mg intravenously and then the test dose, one showed no macroscopic lesions, while the second, which had also first of all been given subcutaneously an immunizing dose of 10 mg showed lesions of the lungs and spleen A fifth baboon, given ten subcutaneous injections of 0 01 mg of smooth bacilli, one being given every other day, and then the test dose, had four tubercles in the spleen and small circumscribed lesions elsewhere Two other baboons given a single subcutaneous dose of 10 mg of smooth-strain bacilli and then the test dose, showed extensive lesions In all cases the controls showed generalized tuberculosis The authors conclude that the intravenous route gives better results than does the subcutaneous, and divided doses better results than a single one

CALEDONIAN

How We Assist in the Purchase of Medical Practices

Scotland's Oldest Insurance Company is prepared to assist Doctors in the buying of Medical Practices or Partnerships The purchase price is repayable over a term of years, and a Life Assurance Policy is taken out as a collateral security This scheme makes it unnecessary for a Doctor to approach his friends to act as guarantors and enables him to pay for his practice out of income After the repayment of the loan, the Life Policy becomes a valuable asset to the Doctor

Many Doctors have already established themselves in practice with the aid of the "Caledonian" Scheme The Interest Rates are particularly moderate *The Accountant's charges for investigating the practice and the Legal Fees for preparation of the deeds and documents in connection with the Loan are paid by the Company in completed cases* Arrangements can be made to meet special cases

ROYAL AIR FORCE MEDICAL SERVICE

Applications are invited from medical men for appointment to commissions in the Medical Branch of the Royal Air Force for entry in January, 1938

Candidates must be of pure European descent They must be British Subjects, the sons of British Subjects and registered under the Medical Acts

Candidates must be under *31 years of age* on the 3rd January, 1938, and will be selected after interview by a selection board without competitive examination

Hospital appointments held since qualifying will, under certain conditions, qualify candidates for antedate of commission up to a maximum of one year, the age of entry may, if necessary, be increased by a period equal to the "antedate"

Selected candidates will be appointed to short service commissions (for 3 years extendible to 5 years) followed by 4 years' service in the Reserve, and will be eligible to be considered for Permanent Commissions during their second or third year of service Officers not selected for permanent commissions receive gratuity as follows, on transferring to the Reserve —

On completion of 3 years—£400
On completion of 5 years—£1,000

Copies of the regulations for entry and conditions of service, including rates of pay and allowances, also form of application, may be obtained on application from —

The Secretary,
Air Ministry (D M S),
Adastral House,
Kingsway, W C 2

Completed applications from intending candidates for the vacancies in January, 1938 must be received in the Air Ministry not later than the 15th of November, 1937

ROYAL NAVAL MEDICAL SERVICE.

Vacancies exist for Medical Officers in the Royal Navy, and applications are invited for entry in January, 1938

Candidates below the age of 28 years are preferred, and they must be registered under the Medical Acts No examination in professional subjects will be held, but candidates will be required to attend for interview by a Selection Board

Selected candidates will be entered for Service for a period of three years in the first instance, which may be extended to five years at the discretion of the Admiralty

At the end of three years' service officers may retire with a gratuity of £400, but those who serve for five years will receive £1,000

At the end of five years' Short Service permanent commissions will be given to selected officers who wish to make the Naval Medical Service their permanent career Officers transferred to the permanent list will receive a gratuity of £1,000 (less Income Tax)

Opportunities are available for officers on the permanent list to specialise, and ample provision is made for Post Graduate study

Copies of the regulations for entry and conditions of service, including rates of pay and allowances, may be obtained from the Medical Director-General of the Navy, Admiralty, S W 1, and from the Deans of all Medical Schools

Applications for entry from intending candidates must be received not later than November 22nd, 1937

COUNTY COUNCIL OF DURHAM

EDUCATION DEPARTMENT

ASSISTANT SCHOOL MEDICAL OFFICERS

The County Education Committee invite applications for the posts of TWO ASSISTANT SCHOOL MEDICAL OFFICERS to act under the School Medical Officer in connexion with the inspection of school children and such other duties as may be required by the Education Committee Commencing salary £500 per annum (provided the candidates have had not less than three years post graduate experience) rising by annual increments of £25 to £700 per annum together with travelling expenses according to the County Scale The successful candidates will be required to devote their whole time to the duties of the office and reside in or near the districts to which they will be attached at places to be approved by the Education Committee The appointments will be subject to three calendar months notice on either side expiring on the last day of any calendar month Applicants must have had experience in the work of school medical inspection and preference will be given to candidates who

(a) Have had experience in the work of School Clinics

(b) Have been accustomed to make special reports on Mentally Defective Physically Defective Epileptic and other Defective children

The possession of a Diploma in Public Health is desirable though not essential

Canvassing directly or indirectly is prohibited and will disqualify

A deduction of 5 per cent will be made from the salary in accordance with the Local Government and Other Officers Superannuation Act 1922 which has been adopted by the Council and the appointment will be subject to passing the County Council's medical examination in connexion therewith

Forms of application to be returned not later than Saturday October 9th 1937 may be obtained from the Director of Education Shire Hall Durham on receipt of stamped addressed foolscap envelope THOS B TILLEY

Shire Hall Durham Director of Education
September 16th 1937

LANCASHIRE COUNTY COUNCIL

PARK HOSPITAL DAVYHULME NEAR MANCHESTER

APPOINTMENT OF SENIOR RESIDENT MEDICAL OFFICER

Applications are invited from registered male Medical Practitioners for the appointment of SENIOR RESIDENT MEDICAL OFFICER at the above Hospital Candidates must be unmarried

Salary £350 per annum together with the usual residential allowances

The appointment will in the first instance be for a period of six months the successful applicant being eligible for reappointment for a further period of six months at the end of that period

PENSIONS & INSURANCE

FOR

MEDICAL PRACTITIONERS

The Insurance Acts Committee of the British Medical Association acting as the executive body of the Conference of Representatives of Local Medical and Panel Committees after protracted investigation recommended to all Insurance Practitioners a

Pension and Insurance Scheme providing

(a) Pension at age 65

(b) Disablement Income

(c) Family Protection

The extraordinarily low rates quoted are available only until

September, 1942

but policies effected prior to that date will not be affected by any alteration made thereafter

The Council of the British Medical Association resolved that this scheme should be made available also to members not engaged in National Health Insurance practice

These policies are issued through the Medical Insurance Agency of B M A House Tavistock Square acting as agents of the nsurance Offices for the collection and receipt of quarterly premiums

Other insurances Motor Household Educational etc, are also available at specially favourable rates

'n this as in all else

Typical Photos of posture correction Picture of 15-year-old girl before and immediately after the application of the Spencer Corrective Support Interval of a few minutes between pictures Nos 1 & 2

Showing Front Fastening

The value of Spencer Supports in correcting posture has long been recognised by thousands of doctors who use them regularly

When we improve posture through a Spencer Corset or Support, we call this INDIVIDUAL DESIGNING Each Spencer Support is designed to meet the individual needs of the patient, from complete measurements and figure description taken by a trained Corsetiere

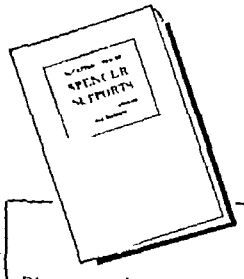
The Spencer, either the Belt or the Supporting Corset, is designed in two sections, to give adequate abdominal support and uplift, and correct back support

SUPPORTS FOR

Maternity	**Movable Kidney**	**Hernia**	**Pendulous Breasts**
Enteroptosis	**Sacro-iliac Strain**	**Post operative**	**Pendulous Abdomen**

BEWARE OF SUBSTITUTION.—Spencer Corsets Ltd regret the necessity of warning the medical profession that in several instances where doctors have specifically prescribed a Spencer Support a corset of another make has been substituted and because its makers do not understand the Spencer principles of individual designing has been unsatisfactory Every genuine Spencer Support bears the SPENCER Label

Trained Spencer Corsetières are resident throughout the Kingdom Name of nearest gladly supplied on request.



A scientifically trained Spencer Corsetière will call at your surgery or at your patient's home to take measurements under your supervision

Mild Constipation shown to yield to laxative effect of HOVIS

Many of the mild forms of constipation so prevalent to-day are attributed to the consumption of foods deficient in Vitamin 'B' In comparing the effects of various kinds of bread it is seen that HOVIS germ bread is superior to either white bread or wholemeal in supplying this deficiency
Whilst white bread contains practically no Vitamin 'B,' HOVIS, with its added proportion of 25% wheat-germ, supplies an abundance of this essential food-element Unlike wholemeal bread, HOVIS contains only a minute percentage of bran and indigestible cellulose In other words its incorporation in the normal diet ensures not only a higher standard of nutrition but easier assimilation and regular evacuation of the intestinal contents.

VITAMIN B' CONTENT ACTS AS AID TO REGULARITY

Made in England

OVALTINE

FOR THE OLD AND FEEBLE

DURING old age when the digestive powers and vitality are on the wane the problem of satisfactory feeding often becomes acute A solution to this difficulty is found in Ovaltine Its delightful flavour appeals to the jaded palate its digestive action aids the enfeebled assimilation while its high nutritive value stimulates the flagging metabolism It is a boon to the aged

In Ovaltine the nutritive constituents of fresh milk eggs and malt are transformed into crisp granules which dissolve readily in milk to form a delicious beverage A cup of Ovaltine in the morning ensures energy for the day and a cup on retiring generally relieves the sleeplessness so common a symptom of old age and gives digestive rest

Ovaltine enriches the diet in certain important factors, notably *calcium* and *vitamins* A and B_2 which recent investigations have shown to promote longevity

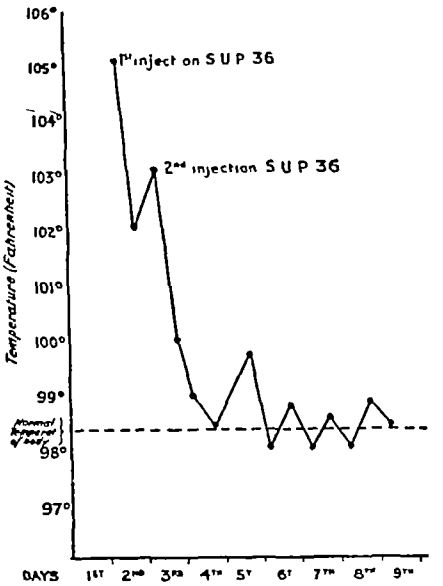
COLLOSOL IODINE ℥ x
Sig ℥ i or ℥ ii thrice daily, after meals,
in a wineglassful of water

As auxiliary measures
COLLOSOL SULPHUR BATHS
℥ iv mitte xii
Sig one bath every fourth day

COLLOSOL IODINE OIL ℥ i
Well rubbed in every night

The success of Collosol Iodine and Collosol Sulphur used separately indicated that as both drugs fill an important place in the treatment of infective and other conditions such as Early Rheumatoid Arthritis, Muscular Rheumatism, Fibrositis, Sciatica, etc., by alternating the treatment a valuable addition to the armamentarium of the practitioner would be afforded Actual clinical results prove that the combination does produce the results expected from theoretical considerations



COLLOSOL IODINE is unaccompanied by the disadvantages usually associated with Iodine treatment It remains stable in the gastric juices and is absorbed in the tissues

COLLOSOL SULPHUR, unlike the ordinary pharmaceutical preparations of sulphur readily combines with proteins in the intestinal tract and is entirely absorbed

'PANOPEPTON'

LEAN BEEF—the entire group of nitrogenous substances those natively soluble and those rendered soluble by physiological hydrolysis amino acids and polypeptids with the natural savoury extractives and minerals

ENTIRE WHEAT GRAIN—the peculiar complex of nitrogenous substances, those naturally soluble and those rendered soluble by physiological hydrolysis, amino acids and polypeptids the farinaceous substance converted into dextrin and maltose and with the associated savoury constituents and minerals

Of the beef nothing is excluded but the indigestible connective tissue and lipoid Of the wheat nothing is excluded but the insoluble inert cellulose and silica of the shell of the grain

'Panopepton' is of a uniform standardized composition, it is highly agreeable, requires no preparation It is a potent restorative and emergency food in serious straits, a fortunate recourse for the invalid

Control of Type I and Type II Pneumonias with

ANTIPNEUMOCOCCIC SERA

Lederle

SUCCESS IN THE SERUM TREATMENT of lobar pneumonias is measured by—

- *a 60% reduction in the death rate of Type I cases*
- *a 40% reduction in the death rate of Type II cases*
  (if treatment is commenced within 96 hours of onset)

Specific antipneumococcic sera offer the only certain means of reducing the death rate in Types I and II pneumococcus pneumonias—the cause of nearly 50% of all adult lobar pneumonias between the ages of five and fifty

The "higher types' claim special interest at the moment because of the opportunity they offer for more extensive control of pneumococcic infections by means of specific serum therapy

Specific antisera are now available for Types V, VII, and VIII, and the results obtained with these have been extremely encouraging Bullowa and Finland have both observed approximately a 70% reduction in the mortality rate of serum treated Type V and VII cases

Success is largely dependent upon prompt bacteriological diagnosis facilitated by the Neufeld Rapid Typing, early and adequate treatment, and of equal importance—the use of serum of the highest quality

Refined and Concentrated Antipneumococcic Serum *Lederle* represents the accrued knowledge gained by years of experience in its manufacture.

Bronchitis, Winter Cough and Sequelæ

There is a vast amount of evidence of the most positive character proving the efficacy of 'Angiers' in sub-acute and chronic bronchitis It not only relieves the cough, facilitates expectoration, and allays inflammation, but it likewise improves nutrition and effectually overcomes the constitutional debility so frequently associated with these cases Bronchial patients are nearly always pleased with 'Angiers' and often comment upon its soothing, "comforting" effects

The unique soothing properties of 'Angiers,' its favourable influence upon assimilation and nutrition, and its general tonic effects, make it eminently useful both during and after influenza It has a well-established reputation for efficiency in relieving the troublesome laryngeal or tracheal cough, correcting the gastro-intestinal symptoms and combating the nervous depression and debility

Purity-Activity-Stability

INSULIN 'A.B.'

Insulin 'A B' was the first British insulin offered commercially to the medical profession. Its manufacture on an industrial scale was the direct result of research carried out by the joint manufacturers in their physiological and chemical laboratories. Its supremacy has been fully maintained by the persistent work of the research staff engaged in its production.

Insulin A B has a world wide reputation for its strictly safeguarded sterility, its carefully standardised strength, its freedom from toxic reactions and its stability in hot climates.

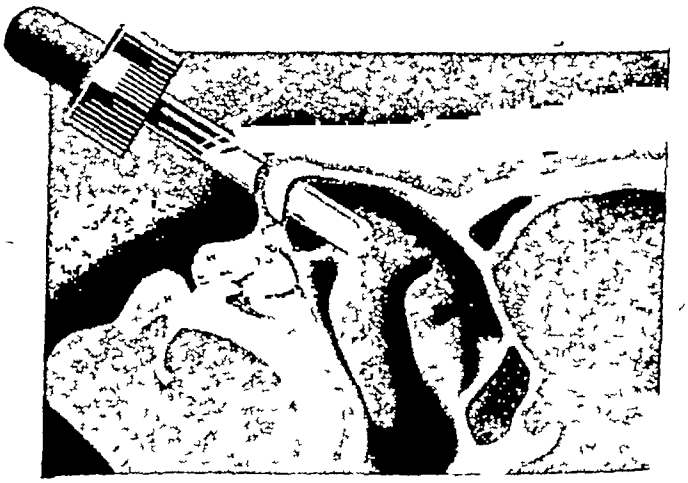
SPECIAL ADVANTAGES OF 'ENDRINE'

IN THE TREATMENT OF NASAL CONGESTION AND CATARRH

The benefits of the oily base –



(1) Ephedrine dissolved in oil produces a deeper and more lasting effect due to the adhesive properties of the oil maintaining contact for a long period with the mucous membrane of the nares

(2) The oil in Endrine has a bland, soothing effect on inflamed mucous membrane

(3) A protective coating is provided which prevents irritation and further infection

(4) The oil base has a more lasting and protective effect than any vapour alone can have

Endrine contains ephedrine, to contract soft tissues thus aiding nasal ventilation and assisting sinus drainage menthol, eucalyptol and camphor which have stimulating and mildly antiseptic qualities and oil, which has a soothing effect on inflamed mucosa

COCAINE—With 1% cocaine solution an average of 173 seconds elapse before the touch of a wooden applicator on the eye-ball is no longer felt

BUTYN—With a 1% solution of Butyn (Abbott) an average of only 68 seconds elapse before the touch of a wooden applicator is no longer felt

COCAINE—With 1% cocaine solution the duration of anæsthesia is no longer than that obtained with 1% Butyn solution. Note the dilatation

BUTYN—With 1% Butyn solution anæsthesia persists for approximately as long as when 1% cocaine is used Note absence of dilatation

RAPID • PROFOUND ANÆSTHESIA

Among local anæsthetics—including cocaine—which are effective on intact mucous surfaces, Butyn is *unique in its ability to produce rapid*, profound and prolonged anæsthesia Butyn is widely used and is recommended for topical application in operative procedures on the eye, nose and throat, as well as for use in genito-urinary work • Butyn 2% Solution the most widely used preparation of the drug has proved to be as effective clinically as a 5% solution of cocaine Used in the eye Butyn does not affect the accommodation nor ocular tension Neither does it cause drying of the conjunctiva as does cocaine Two or three drops of the 2% Solution in the eye are sufficient for the removal of impacted foreign bodies or for the relief of pain due to abrasion of the cornea

For operations stronger solutions (up to 5%) are employed • Topical applications of Butyn 2% Solution *are sufficient for operations in the* nose and for surface anæsthesia in the throat For genito-urinary use, Butyn gives excellent results even in cases where the mucosa is extremely painful • Butyn is non-narcotic and is not habit forming Its solutions are slightly antiseptic, stable and may be boiled • Butyn 2% Solution is available in 1-ounce bottles through prescription pharmacies Butyn is also issued in 3-grain tablets and in powder form Descriptive literature will be sent on request The coupon is for your convenience

For Intestinal Stasis

VISCOSITY AND LUBRICATION THERAPY

One of the most important tests in connection with the preparation of mineral oil for therapy is that for viscosity

The viscosity of Nujol is physiologically correct at body temperature

When Nujol is prescribed the practitioner is protecting the patient by using the standardised intestinal lubricant

Lubrication therapy is preventive therapy Correct lubrication therapy implies Nujol therapy

Nujol

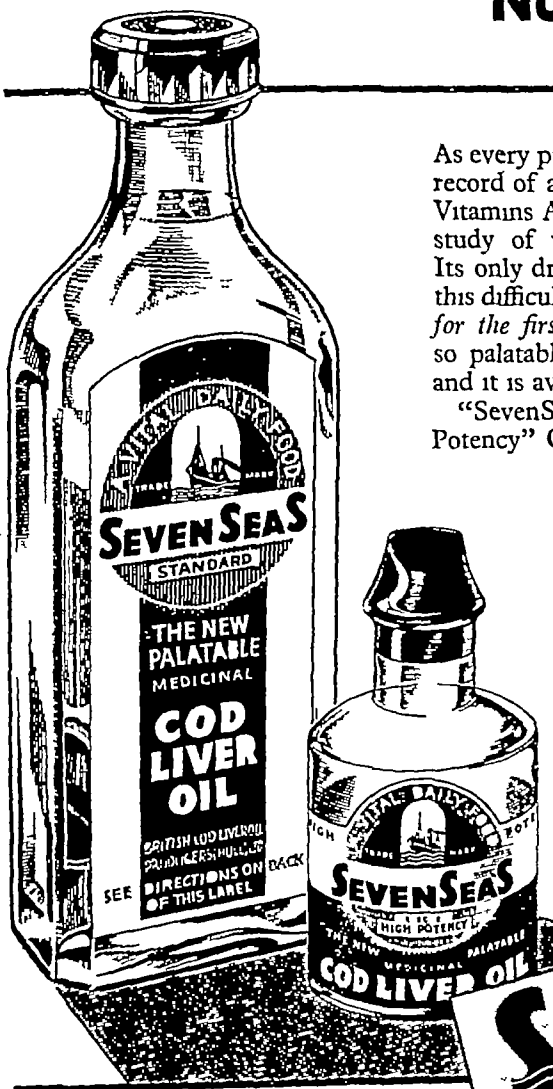
costs the patient only

1/6 or 2/6

(8oz or 16oz bottles respectively)

CREAM OF NUJOL

Indicated in cases where a plain oil, however bland and tasteless - is not tolerated A delightful emulsion of Nujol free from sugar or medicaments Cream of Nujol contains only Nujol, emulsifying agents and flavouring 16 oz —3/6



Samples of Nujol and Cream of Nujol for clinical test obtainable from

Cod Liver Oil

is the Liver Oil with the

OFFICIAL BACKING OF THE MINISTRY OF HEALTH AND LEAGUE OF NATIONS NUTRITION COMMITTEE

As every practitioner knows, no other liver oil has such a record of achievement as Cod Liver Oil For it contains Vitamins A and D in the right proportion In fact, the study of vitamins originated through Cod Liver Oil Its only drawback in the past has been its taste Now this difficulty has been overcome "SevenSeaS" provides, *for the first time*, Cod Liver Oil in a palatable form—so palatable that it can be taken with ordinary foods, and it is available in "High Potency" form, too

"SevenSeaS" is obtainable in three forms (1) "High Potency" Oil—four times "B P" standard, (2) "High Potency" Capsules containing 5 min dose of "High Potency" Oil, (3) Standard "B P" Oil We would like all practitioners to prove "SevenSeaS" "High Potency" Cod Liver Oil to their own satisfaction Please send to the address below for a free sample

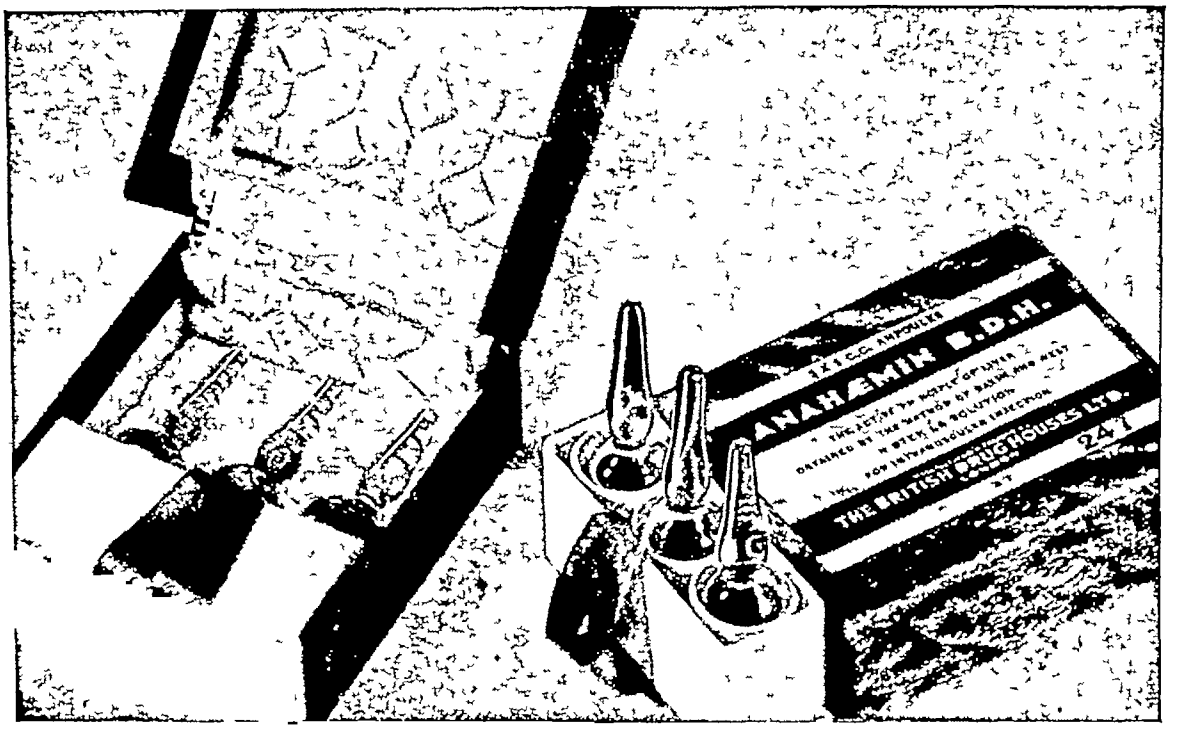
THE PHYSIOLOGICAL VALUE OF THE BANANA

II. Protein: The proteins in plants are biologically inferior to the proteins from animal sources, because they do not yield *all* the varieties of nitrogenous bodies (amino-acids) demanded by the human organism for full development.



But, while incomplete, they have a full caloric value, and are useful in diluting the complete proteins of animal origin. A leading authority states that about half animal and half plant protein gives the best biological value in a diet.

The amount of protein—average 1·3 per cent.—is higher in the banana than in the majority of raw fruits.

NB In the fully ripe banana the starch content is reduced to about 3 per cent., having been converted into soluble sugars. A banana is ripe when all green has disappeared from the skin and brown spots have formed upon the yellow surface.

ISSUED BY ELDERS & FYFFES LTD., 31-32 BOW STREET, LONDON, W.C.2

ANAHÆMIN B.D.H.

In the treatment of pernicious anæmia

In the majority of cases of pernicious anæmia treated with Anahæmin the response is so certain that, in the words of one well-known physician, 'it is possible almost to guarantee a rise of half a million in red blood count weekly from a weekly 2 c c injection indeed, this dose seems usually to be too large ' On the other hand, some physicians arrange their own scheme of dosage, one such physician states 'I give 4 c c in a week leaving off all treatment for about six weeks I have had excellent results Anahæmin has never let me down it is easily the best liver preparation'

In either event, whether the orthodox or a special dosage be adopted, the blood count in average cases is restored to normal within a few weeks, after which period it can be maintained by monthly injections of 2 c c

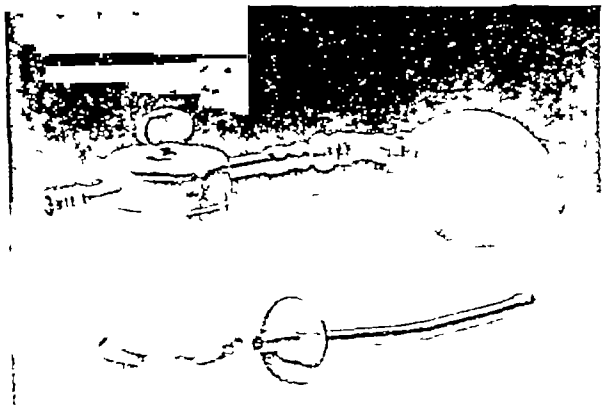
Vaginal Dry Treatment

On the treatment of Vaginal Discharge nothing more significant has been written than the following extract from the paper on Venereal Diseases in **THE PRACTITIONER,** *October, 1937* —

"Fissan—In the treatment of gonococcal infection of the female, the most practical advance recently is the use of fissan powders Fissan is a highly absorbent powder of lactalbumin combined with such drugs as silver proteinate or ichthyol It is in fine division and is highly absorbent The technique advocated is to cleanse the vulva and vagina by swabbing and then to introduce a fairly large deposit of fissan medicated powder at the external os by means of a powder insufflator Then the vagina and vulva are covered by a fine film of the same powder The treatment is repeated daily The urethra is treated by instillation of silver compounds such as argyrol, 10 per cent, or neoprotosil, 10 per cent This method is clean, and easily and rapidly carried out The powder is free from staining or odour, and is cheap There is the minimum risk of producing upward spread of the infection by the introduction of instruments into the cervical canal and urethra The fissan powders are likely to prove very valuable in the treatment of vulvo-vaginitis of children"

THE FISSAN POWDER SPRAY has been specially designed for the convenient and proper application of Fissan Powders

This improved powder applicator for cavities, supplies at will either a simple dusting or projects a sufficient amount of powder for forming a deposit



A very simple cartridge method of charging combines economy and hygiene

This apparatus is made completely of metal and chromium plated inside and outside, so that after removal of the rubber bulb every part can be sterilised

The powder content is adequately protected against contamination from the vaginal discharge

A simple turn of the regulator tap cuts off the powder supply and allows the removal of every trace of residue from the attachment Fissan Brand Absorbent Powder, Ichthyol Powder and Silver Powder are made up in special cartridges for use in the Powder Spray

Fissan POWDER-SPRAY

21/- *(No breakable or perishable parts)*

Special Cartridges of Fissan Powder, 1 6 per box of three (Each Cartridge sufficient for several applications)

Modern Iron Therapy

Iron 'Jelloids' are an elegant and reliable means of administering the proto-carbonate of iron. The preparation has none of the disadvantages of Pil Blaud The iron content remains fresh and unoxidized indefinitely, and injury to the teeth is avoided

The Jelloids' are highly effective in the treatment of achlorhydric anaemia and indeed in all the simple anaemias in which massive iron therapy is indicated

Iron Jelloids

You are cordially invited to apply for samples for clinical test

September 29, 1937 By Order of the Council G C ANDERSON, *Secretary*

BURY INFIRMARY (LANCS)
(127 Beds)

RESIDENT SURGICAL OFFICER (MALE).

Applications are invited for the above post from those holding the Fellowship of one of the Royal Colleges of Surgeons

The appointment is for a term of one year with provision for an extension of a further twelve months and the successful candidate will be expected to commence duties immediately

Salary will be paid at the rate of £400 per annum together with board residence and laundry

Applications stating age qualifications and nationality together with copies of three recent testimonials are to be addressed to the undersigned and should be forwarded as soon as possible, endorsed R.S.O.

H. WILKINSON
Superintendent.

STROUD GENERAL HOSPITAL,
Stroud Glos

RESIDENT MEDICAL OFFICER required Candidates must be fully qualified and registered Six months appointment from October 20th Salary £160 per annum with board and laundry Applications stating nationality together with copies of three recent testimonials to be sent to the undersigned from whom further particulars may be obtained

C FORD SPENCER
Secretary

THE LADY CHICHESTER HOSPITAL HOVE, FOR FUNCTIONAL NERVOUS DISEASES
(60 Beds.)

SENIOR HOUSE PHYSICIAN required Six months appointment at £100 per annum all found Also JUNIOR at £50 per annum Valuable experience for Diploma in Psychological Medicine.

Duties to commence immediately Applications with testimonials to be sent to the Secretary Mr P F Spooner 33 West Street, Brighton.

August 21st 1937

CITY MENTAL HOSPITAL, HUMBERSTONE LEICESTER

THIRD ASSISTANT RESIDENT MEDICAL OFFICER (male single) under 30 Residential General Hospital experience is desirable. Salary £350 rising by £50 per annum to £450 per annum together with board lodging washing and attendance valued for purposes of superannuation at £150 per annum An additional £50 per annum will be paid for possession of a D P M

The appointment is subject to the provision of the Asylums Officers Superannuation Act 1909

There is a good laboratory and two active Psychiatric Clinics one attached to the Leicester Royal Infirmary

Applications giving particulars of experience etc together with names of three references one of which should be non-professional and marked A M O " to be sent to the Medical Superintendent.

SMEDLEY'S HYDROPATHIC ESTABLISHMENT MATLOCK

HOUSE PHYSICIAN male unmarried and fully qualified required Salary at the rate of £200 per annum with residence board and laundry Appointment for 12 months renewable if suitable with view to permanency with good prospects Previous experience in resident Hospital appointment preferred Duties include attendance at local hydropathic Hospital Applications stating qualifications experience age and nationality together with copies of three recent testimonials to be sent to Dr Harbinson Smedley's Hydro Matlock before October 31st 1937

STIRLING DISTRICT MENTAL HOSPITAL LARBERT

JUNIOR ASSISTANT MEDICAL OFFICER required (male) Salary commencing at £300 per annum with board lodging and laundry Appointment subject to provisions of Asylums Officers Superannuation Act Apply stating age and experience with testimonials to the Medical Superintendent.

ROYAL ASYLUM OF MONTROSE.

Applications are invited for the post of PHYSICIAN SUPERINTENDENT to the Royal Asylum of Montrose Salary £1,200 per annum rising by annual increments of £50 to £1,400 with free house and garden local rates electricity and the services of a chauffeur gardener for whom a house will be provided

Superannuation allowance under the Lunacy Scotland Act 1866

Applications stating age qualifications and previous experience along with 35 copies of testimonials to be submitted on or before October 11th 1937 to C K Alexander Clerk and Treasurer Royal Asylum, Montrose Scotland.

MANCHESTER AND SALFORD HOSPITAL FOR SKIN DISEASES
(54 Beds 16,500 Out patients per annum)

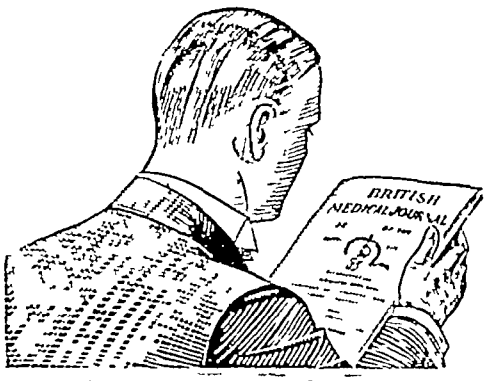
HOUSE SURGEON

Applications are invited for the post of House Surgeon Must be registered The appointment is for six months Salary at the rate of £150 per annum with board and residence

Applications with copies of three testimonials, to be sent to the undersigned Quay Street, Manchester not later than October 7th

JOHN NALL,
Secretary

DERBYSHIRE HOSPITAL FOR SICK CHILDREN
(80 Beds)



Wanted—forthwith—RESIDENT HOUSE PHYSICIAN (LADY) Salary £130 p.a The appointment is for six months Applicants must be fully qualified Applications with three testimonials to be sent to the undersigned

Mouth and Throat Therapy.

AS A PROPHYLACTIC MEASURE IN EPIDEMICS, AND FOR USE IN THE TREATMENT OF SEPTIC CONDITIONS OF THE MOUTH AND THROAT, THE VALUE OF A SUITABLE LOCAL APPLICATION IS FIRMLY ESTABLISHED

EXHAUSTIVE BACTERIOLOGICAL TESTS AND CLINICAL TRIALS CARRIED OUT OVER A NUMBER OF YEARS DEMONSTRATE THAT "FORMITROL" PASTILLES MEET THE DESIRED NEED IN A SATISFACTORY MANNER.

"FORMITROL"

BRAND

Formalin Pastilles.

THE FOLLOWING APE A FEW OF THE CHIEF ADVANTAGES THEY POSSESS—

1. "Formitrol" Pastilles dissolve slowly and uniformly in the mouth, this ensures prolonged and continuous effect of the active ingredient—Nascent Formaldehyde.
2. "Formitrol" Pastilles exercise a marked bactericidal action without irritating the mucous membrane
3. "Formitrol" Pastilles bear surface grooves, which permit the administration of small doses to children
4. "Formitrol" Pastilles are metallic sheathed, evaporation is thus prevented and full activity of the products can always be relied upon

Issued in neat containers for the pocket, and supplied by all Pharmacists at 1/6 per Box

Works King's Langley, Hertfordshire

M 139

it below the opening in the dura mater, all round, and then filling the bone defect with celluloid, one-sixteenth of an inch thick laid upon a shelf made by chiselling completely round the bone margin The layer of thin celluloid was used with the idea of having a perfectly smooth surface which might exert a slight pressure upon the brain wound and prevent broad and extensive adhesions from forming between it and the dura mater I believe that it was definitely useful The scalp incision was always close sutured with deep and superficial stitches and without drainage In several of the patients fluid—blood serum or cerebrospinal fluid—collected beneath the flap, at times causing considerable tension, this fluid was removed by aspiration through the substance of the flap, repeated as often as necessary until the flap came to lie permanently on the surface of the plate I am of the opinion that the removal of fluid from the cavity of an aseptic surgical wound through the cut edges of the wound is a surgical error, for it constantly leads to sepsis The fluid should be aspirated through the otherwise intact skin

The chief purpose of these notes is to indicate that celluloid is a thoroughly satisfactory material for the object in hand, provided that asepsis can be maintained

Its durability is proved by the fact that in nine patients examined this current year the plates which were inserted in 1916–17 are to all intents as good as on the day of operation and are all fitting accurately

Of the six patients reported in 1906 the after-history of only two of them is known One of these a man with a large plate in his right temporal fossa, lived for thirty years and died from senile gangrene, with the plate *in situ* The other a female, was the first patient for whom I used celluloid This was in 1897 to fill a gap that had been produced by the removal of a tumour of the left frontal bone the diagnosis of which lay between sarcoma and gumma, and which had not reacted to a course of anti specific treatment of those days being still the cause of intense pain It was removed ten years before Wassermann's test or Ehrlich's treatment had been elaborated, but when the test was ultimately made and a positive reaction obtained the treatment was given with an entirely satisfactory result This patient is still alive and well with the plate *in situ* just forty years after it was inserted At that time it had been moulded into a dome shape that corresponded fairly accurately with the natural convexity of the left frontal bone Several years later the patient received a severe blow upon the plate with the result that it was considerably flattened, but it possibly saved a brain contusion

As further evidence of the resisting power of celluloid another patient, also with a frontal plate while working as a gardener was struck with the flat surface of a spade sufficiently heavily to produce a scalp wound over his plate but without further injury And one of the epileptic patients with a frontal plate who was recently seen volunteered the statement that during his fits he had often had his forehead bruised and felt sure the plate had given definite protection These facts regarding its resistance to external violence and its durability indicate that celluloid is an excellent substitute for transplanted bone which is only superior to it in that it can become an integral part of the skull

The total number of men doctors in Germany has risen from 52,342 in 1935 to 55 259 or 5 6 per cent The number of women doctors during the same period has risen from 3 644 to 4 339, or 19 1 per cent

SOME UNUSUAL CASES OF GLAUCOMA SECONDARY TO INJURY*

BY

R AFFLECK GREEVES, F R C.S

Senior Ophthalmic Surgeon Middlesex Hospital

The occurrence of glaucoma as a complication of ocular injuries both non perforating and perforating is familiar to all of us and I think I may say that in most cases a satisfactory explanation for its development can be given The cases which I am about to describe, however, seem to me to be worthy of report, because not only do they not belong to any of the commoner types, but I am not aware that similar cases are to be found in the ophthalmological literature Unfortunately the mechanical explanation of the rise of tension in each of these is so far as I am concerned so obscure that I am unable even to make any reasonable suggestions, but I can at least inform you fully as to how three of the four cases reacted to treatment

Case I

My first case is one in which the glaucoma was the result of a non perforating injury A man 21 years of age when playing Association football received a blow on his left eye—he thinks that the loose end of the lace of the football struck him The eye was very painful at the time but the pain disappeared in the course of a day or two and the sight seemed to be unaffected Some time after the accident—he cannot say definitely when—he had a sudden attack of misty vision associated with neuralgic pain and haloes. Similar attacks occurred at intervals especially in the evening, and these became gradually more frequent and severe I first saw him two months after the accident—he was then having a particularly severe and prolonged attack the eye having been painful and the sight misty for two days The left cornea was slightly hazy the pupil semi-dilated and sluggish the tension was raised and arterial pulsation in the retinal arteries was present there was no cupping of the disk the vision with a −1D sphere was 6/9 partly After instillation of 1 per cent eserine the tension became normal in half an hour Apart from the increased tension no abnormality of any kind could be found the anterior chamber was of normal depth and the lens in place and undamaged After the fall of tension to normal vision was 6/5 with a +1D sphere The field of vision was full The patient was delighted with the effect of the eserine and I prescribed 1/4 per cent eserine drops twice daily This kept the tension normal for a time but if the eserine drops were left off the attacks began again The patient came to see me several times just as one was beginning and on each occasion the eye became temporarily myopic just before and during the attack. After about two months as the attacks recurred directly the eserine was discontinued I decided to operate several of my colleagues saw the patient, and agreed that this was the right thing to do As the only abnormality discoverable was a suggestion of increased flare in the aqueous I thought it best to begin with a paracentesis The result of this procedure was that the attacks ceased for a fortnight, but after that they recurred again as badly as ever I then trephined the eye. Two days afterwards when I was dressing the eye, the patient closed the other one and said that everything looked distorted On examining the fundus I saw an enormous papilloedema of about 6 dioptres measurement and numerous large retinal haemorrhages surrounding the disk The papilloedema subsided in about three weeks the haemorrhages ultimately disappeared and two months after the operation central vision was 6 4 unaided The visual field however showed a general peripheral constriction especially marked on the temporal side The constriction of field was accounted for by a reduction in size of the peripheral retinal arteries

* Read in the Section of Ophthalmology at the Annual Meeting of the British Medical Association Belfast 1937

Relieves coughing without opiates

'Kres-Lumin' presents in an agreeable fluid form a combination of an efficient non-narcotic sedative and a non-nauseating expectorant In all respiratory diseases accompanied by cough it serves the double purpose of loosening tenacious secretion, thus facilitating expectoration, and of controlling irritable and useless cough

'Kres-Lumin' is well tolerated by patients with sensitive digestions, and does not cause drowsiness It is therefore of value in children.

The indications for 'Kres-Lumin' are colds, influenza and whooping-cough and all conditions in which cough is a prominent and troublesome symptom

'KRES-LUMIN'

BAYER

which had a thread-like appearance This state of affairs has now persisted for over ten years No further attacks of raised tension have occurred in spite of the fact that the trephine hole became closed in the course of a few months. At the present time the eye looks exactly the same as the other—there is no cupping of the disk and apart from the field constriction, which is greatest on the temporal side, and the thinning of the retinal arteries peripherally there is no visible abnormality The central vision remains 6/4 unaided, neither hypermetropia nor myopia being present

Quite recently I saw another case, similar in some ways to the one just described

Case II

The patient is a man, 30 years of age, who gives a history of a blow on the eye twenty two years ago Central vision has never been good since the accident Eight years ago he began to have occasional attacks of haloes and pain, these being first noticed when diving The attacks subsequently occurred more frequently When I first saw the patient the disk was deeply cupped, and an area of pigmentation due to commotio retinae was present below the macula, the latter appearance probably accounting for the diminution of vision immediately following the accident A large iridodialysis was also present in the lower segment—this too had been caused by the accident. Nothing else abnormal was seen the lens was in place and the anterior chamber of normal depth The iridodialysis being a large one a considerable part of the iris root was completely separated from its attachment, leaving that part of the filtration angle widely open The cupping of the disk was definitely glaucomatous, and the patient had recently become aware that the nasal part of his visual field was deteriorating In this case no symptoms of glaucoma appear to have set in until fourteen years had elapsed since the accident No treatment has as yet been undertaken

Case III

The other two cases which I am about to describe are of glaucoma arising from a perforating injury—to be more exact, from the retention of an intra-ocular foreign body The first case is that of an engineer aged 50 who consulted me because of failure of vision in the right eye which he had observed over a period of seven months He had seen two oculists in America, both of whom had diagnosed glaucoma and had advised operation but neither had suggested a cause for the condition When I first saw him the left eye was normal, except for a small myopic error The tension of the right eye was definitely raised and the optic disk showed early cupping. In addition a hole about 2 mm in diameter was visible in the iris on the nasal side and through this hole a red fundus reflex could be obtained Immediately in front of the hole a minute scar from an old perforating injury could be seen in the cornea In the vitreous a considerable amount of fine floating opacity was visible The pupil was small and only just reacted to light on instilling homatropine partial dilatation resulted and a small localized lens opacity was observed just below the iris hole Otherwise the effect of the mydriatic was to cause further rise of tension which again fell to its original level but not to normal, on contraction of the pupil with eserine The anterior chamber was of normal depth The visual acuity was 6/9 partly An x ray picture of the right orbital region revealed the presence of an intra ocular foreign body 8 mm below the horizontal line 1 mm to the nasal side of the vertical line and 7 5 mm deep to a plane tangential to the surface of the cornea On putting the eye up to the Haab magnet the foreign body gave evidence of being magnetic It was impossible to remove this by the anterior route but by repeated daily applications of the magnet it was gradually pulled forwards until it lay immediately under the sclerotic After each application of the magnet the change in position was verified by an x ray picture Finally I made a meridional incision in the sclerotic over the site of the foreign body which was successfully extracted with the magnet and which proved to be a small chip of steel On its removal the tension fell to normal and was still normal two months after the operation when I last saw the patient On this occasion I instilled homatropine to note its effect. The pupil again dilated partially, but the intra ocular tension was not affected The visual acuity was now 6/6, and I attribute the improvement in vision to the fact that the vitreous had become much clearer One curious point about the case is the complete absence of siderosis, and in this connexion it has been suggested that a foreign body composed of one of the modern non rusting varieties of steel might not give rise to siderosis if retained intra ocularly The patient himself was quite unaware that a chip of metal had entered his eye and could not remember that any accident had occurred He is a designing engineer and does no manual work himself but is frequently in the neighbourhood of workmen who are engaged in hammering metals of various kinds

Case IV

My last case is similar in essential points to the one just described The patient, a chauffeur came to Moorfields complaining of attacks of pain and misty vision in the left eye He thought that a piece of china had gone into the eye about seven months before, since when the sight had gradually failed On examination the right eye was normal but the left showed a hazy cornea, raised tension, and a cupped disk, the anterior chamber being of normal depth A hole was present in the iris on the nasal side, and a small corneal perforating scar could be seen opposite to the hole, as well as a localized lens opacity The pupil was slightly dilated and did not react at all *X* ray examination revealed the presence of an intra ocular foreign body in the vitreous which, however, gave no response to repeated applications of the magnet The disk was deeply cupped and pale and vision was reduced to counting fingers at a metre In this case I performed a trephining operation, which successfully reduced the tension to a normal level

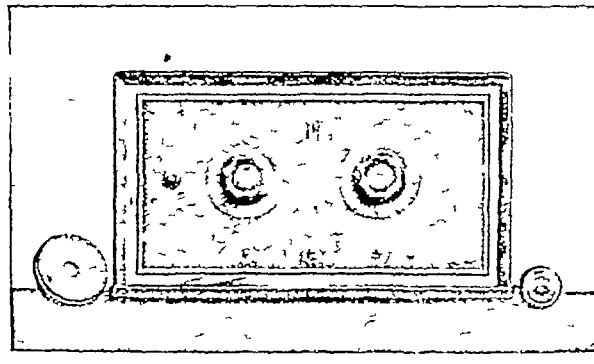
Commentary

I cannot offer an explanation of the rise of tension in any of these cases In the first case the occurrence of papilloedema and retinal haemorrhage, with ultimate peripheral arterial constriction, may perhaps suggest that the fundamental disturbance was a vascular one An alteration in the drainage channels of the eye seems to me to be unlikely in view of the persistence of normal tension in spite of the closure of the trephine fistula In the second case, too, an interference with drainage seems improbable, especially bearing in mind the wide iridodialysis below Again, in the third case the circulatory mechanism of the intra-ocular fluid appeared to function satisfactorily after the foreign body had been removed No permanent leakage could possibly have taken place through the small scleral wound In the fourth case the glaucoma was relieved by a trephining operation

---

The Swedish State Bacteriological Institute has recently moved into new premises at Huvudsta, a suburb of Stockholm The new institute forms a town in itself, comprising three laboratory buildings and five pavilions for the animals necessary for the work With all requisite laboratories and chemical, photographic, and optical departments library, etc, it presents several new and interesting features In the main building, three stories high, a giant refrigerator stretches from the ground floor upwards through all the floors, and constitutes a storing place for the various sera and vaccines produced at the institute Each floor has a separate refrigerating room for the preparations dealt with in the different departments In one department, where sterilization work is carried on, special air-conditioning by means of water and wadding floors has been arranged to guard the work against infection

HEARING TEST SERVICE



In response to many requests, Allen & Hanburys Ltd have extended their Acoustic Department and Hearing Test Service To the modern equipment already in use have been added two of the New Western Electric 6a Audiometers

New Western Electric

6A AUDIOMETERS

With special masking device for bone-conduction tests

(*Brochure on request*)

Members of the Medical Profession are invited to make full use of the service, details of which will be sent on request The Department also offers facilities for deaf patients to test all types of reliable hearing aids without obligation to purchase Our Acoustic Research Department is at the disposal of all doctors interested in the technical development and performance of modern hearing aids

BENZEDRINE IN SEA-SICKNESS

BY

JOHN HILL, M D

Surgeon R.M.S. Aquitania

The introduction of benzedrine (beta-phenylisopropylamine) sulphate, with a powerful action more or less sympathicotropic, has naturally suggested its use in sea-sickness, in which there is commonly a predominant vagotonia The action of the drug is threefold (1) stimulant to the central nervous system, including the higher cerebral centres, hence it has been used with benefit in narcolepsy and post encephalitic Parkinsonism, as also in various conditions associated with fatigue, depression, and lethargy, (2) pressor to the vasomotor system an effect which steadily diminishes with repetition, and may finally disappear, (3) it relaxes smooth muscle in the gastro-intestinal tract, especially in conditions of spasm, whether due to reflex functional, or organic causes, this property has been utilized to facilitate *x*-ray investigation of suspected ulcer and other conditions associated with spasm Contraindications arise from three sources excitability, nervousness insomnia, hypertension and coronary or other established heart disease, conditions of gastric or intestinal atony

Tainter (1933) describes benzedrine as pseudo-sympathicotropic," the results from its use not being precisely those of sympathetic stimulation Except in large doses it has little effect on the pupil Peoples and Guttmann (1936) found very slight changes in blood sugar and gastro intestinal activity Its action on the stomach and intestine has been fully investigated by Myerson and Ritvo (1936) who found that although it abolished spasm, it had very little effect on peristalsis, unlike ephedrine as investigated by Van Liere and others (1936), it relaxed the sphincter and allowed the stomach to empty more rapidly than normally But their observations seem to have been confined to cases of gastro intestinal spasm, in which benzedrine was used as an aid to x-ray investigation That the action on the stomach is at least in part local is suggested by their statement that the effects reach a maximum in fifteen to thirty minutes and begin to diminish in an hour

Effect of Benzedrine in Health

Twenty adult volunteers—eleven men (average age 35.2) and nine women (average age 37.5)—were given doses of 10 or 20 mg In some it was repeated after three days or more Changes in (*a*) blood pressure (*b*) pulse rate and (*c*) subjective sensations were recorded at intervals varying from one hour to twenty four hours afterwards All cases here recorded were under observation at approximately the same time of day so that physiological changes due to such causes as food and exercise might be reckoned with and discounted in estimating the final results

BLOOD PRESSURE

The most consistent change was a rise of blood pressure The effects of benzedrine are so variable that there has hitherto been some difference of opinion as to the blood pressure changes which it produces Myerson (1936) found no rise of pressure after doses of 10 mg. Peoples and Guttmann (1936) considered the systolic to be more affected than the diastolic In the present series the systolic pressure rose in every case after 20 mg. and in 80 per cent after 10 mg Absence of diastolic rise was seen in those who showed no increase of systolic pressure In two others there was no change in diastolic pressure until eleven hours after the dose which was 10 mg in one case and 20 mg in the other (It is probably coincidental but worth noting that these exceptions were all women) A definite rise of diastolic pressure was found in all other cases. On the average it was indeed relatively greater than the systolic increase but occurred later and was longer sustained. The pulse pressure was raised for the first two to two and a half hours after which it fell and remained below normal during most of the period of observation

A systolic pressure originally low showed a greater tendency to rise than one which was at first comparatively high but there was always some rise To a less extent this seemed true of diastolic pressure but a high diastolic pressure tended to fall The rise in pulse pressure was greatest when the first reading was low The increase in mean readings after 20 mg (both systolic and diastolic) was surprisingly little more than it was after 10 mg This suggests that (*a*) individual sensitivity varies widely or (*b*) the effect is reduced by repetition Both factors are probably operative but a third possibility is introduced by the fact that (*c*) it is in states of extreme fatigue that benzedrine usually produces its most dramatic results This observation should be correlated with the greater increase in conditions of low blood pressure From the fact that increased arterial pressure was usually accompanied by flushing of the skin it is reasonable to suppose that the essential change is constriction of the splanchnic vessels A difference much more striking than that dependent upon dosage was the greater susceptibility of males as compared with females particularly to small doses (10 mg.) It is true that in so few as twenty cases there is room for the confusing irruption of coincidence The same criticism may well be levelled against all the foregoing observations, which must therefore be accepted with equal reservations

PULSE RATE

By the end of an hour the resting pulse rate had increased in seven cases with a mean rise of 9.4 per cent. In five cases it was unchanged In the remaining eight it was slowed with a mean retardation of 12.6 per cent Cases with no rise in pulse rate after an hour showed a systolic increase which was slightly less and a diastolic increase considerably more than the average for the whole group The action of a carotid sinus reflex may be presumed From the end of the second hour some degree of quickening of the pulse was the rule

SUBJECTIVE EFFECTS

1 The commonest group of changes reported were gastro-intestinal Impaired appetite constipation and various forms of mild abdominal discomfort occurred in ten cases (50 per cent) Recovery was complete within twenty four hours It is noteworthy that only two out of that number experienced any degree of euphoria

2 Eight patients (40 per cent) felt distinctly exhilarated and this effect was much more pronounced than any of those in the first group Stimulation of the higher centres was shown in unwonted talkativeness and vivacity Five of the eight also commented on increased physical energy

3 In seven others (35 per cent.) there was unmistakable stimulation but the effect was decidedly disagreeable—flushing and sweating on slight exertion and sometimes a disconcerting tremulousness. Three patients described all the bodily changes of fear without the corresponding emotion

4 Six (30 per cent) complained of insomnia even twelve hours after taking the drug. Four of these had previously enjoyed pleasant stimulation

5 Other undesirable effects were disturbed salivary secretion thirst, unpleasant taste in the mouth (25 per cent) cardiac effects, palpitation and evanescent precordial discomfort (20 per cent.) Three patients (15 per cent.) complained of subsequent fatigue and depression without insomnia one of these had been slightly stimulated mentally the other two had experienced only tremor and unpleasant excitement.

6 Three patients felt no change after 10 mg.

EFFECT ON MOOD

The effect of benzedrine on mood varies from time to time in the same person Conditions of greatest fatigue seem to show the most striking excitation Wilbur and others (1937) have found that psychoneurotics who are anxious highly nervous and apparently stimulated had their previous condition exaggerated Stimulation is not always pleasant

Effects of Benzedrine in Sea-sickness

For various reasons it is not feasible to make accurate records of blood pressure in the sea-sick The observations here described were therefore confined to changes in pulse rate, the patients general condition, and the various signs and symptoms of sea-sickness

Price (1933) has described as one of the clinical signs of low blood pressure ' increase in the cardiac rate of more than 10 per minute when the individual assumes the upright posture after lying down " This rule had to be modified according to the limitations imposed by fully developed sea-sickness, the victims of which show a not unnatural reluctance to stand up for any such purpose The pulse was counted with the patient first recumbent, then sitting up in bed Ignoring the brief acceleration occasioned by the effort of rising, which ends usually in from 5 to 10 seconds, one finds that the average pulse rate in health increases by roughly 10 per cent In proportion as the increase in rate exceeds this figure systolic pressure and pulse pressure are likely to be lower than normal

For the purposes of this analysis one hundred cases of sea-sickness have been examined Except in so far as conditions of hypertension, cardiac disease, and any unusual degree of excitability are contraindications to the use of benzedrine, these cases were taken consecutively as they presented themselves, and were not in any other sense selected As it takes some time to collect data of one hundred sea-sick cases aboard a liner justly famed for her stability, the period of the investigation has allowed of some coming under observation on a second occasion, when previous knowledge of their response to disturbing movement proved of the greatest value and threw light on the possibilities of prevention

Age and Sex Incidence

The sea-sick group comprised eighty two women and eighteen men Their average ages were 36 6 and 33 2 respectively, thus closely approximating to those of the normal cases already described The decennial age group 25–35 included twenty-seven, and thirty-two were between 35 and 45 That is to say, fifty-nine of the hundred were between 25 and 45, which corresponds to the usual distribution

The ratio of eighty-two women to eighteen men should not be taken as a true index of the sex incidence of sea-sickness By one of the oddities of human nature men will often conceal it if they can

Classification of Results

The classification of results was necessarily somewhat arbitrary They were grouped in three categories (1) satisfactory results, (2) doubtful results, (3) failures

(1) *Satisfactory results* were obtained in thirty-nine cases in all of which the improvement was unequivocal, every likely fallacy having been carefully excluded Those responding to benzedrine alone showed a mean pulse rate of 69 recumbent increasing by 18 per cent on sitting up, in the group of failures the corresponding figures were 77 and 11 per cent—that is to say, a tendency to vagotonia predominated in the first group It is doubtless in the vagotonic variety of sea-sickness that benzedrine finds its greatest usefulness In its mode of onset this sickness reproduces in slow motion the prologue to an attack of syncope, especially that attributed by Gilchrist (1937) to a hypersensitive carotid sinus an uneasy sense of helpless weakness, a light-headed feeling of dizziness, cold sweats, and vague abdominal unrest, accompanied by slowing of the heart-beat and an abrupt fall of vasomotor tone The clinical signs point to a disturbance of the stabilizing control of the circulation whereby the effects of low arterial pressure are neutralized by tachycardia, and vice versa Hence the predilection of the patient for the horizontal position

(2) *Doubtful cases* numbered forty This group comprised not only those of whom it was doubtful if they had improved but also those concerning whom there was any room for doubt as to how improvement had been brought about The following factors were taken into account

(*a*) Age of Patient—Experience shows that sea sick patients in their teens usually recover, with or without treatment, sooner than those ten or twenty years older All patients under 20 have therefore been relegated to the "doubtful" class, whatever spectacular results ensued It may be mentioned here that for young children even very small doses of benzedrine seem to be unsuitable, while in the elderly its pressor effect is a definite contraindication

(*b*) Duration of the Attack—Another of the lessons of experience is that natural recovery occurs in the majority of cases after about the third day This may be due to adaptation to the movement, but on the other hand it is exceptional for consistently bad weather to continue for more than three days Cases with a history of three days or more were therefore likewise classed as doubtful

(*c*) Any evidence of spontaneous improvement before treatment was begun was also assumed to prove that any benefit observed might be due to a natural tendency to recovery

(*d*) The vagaries of Atlantic weather further confused the issue in some cases The ordinarily sea-sick person is apt to be indifferent to minor changes of weather, but there are times when the improvement must be manifest to all but the moribund

(*e*) Undesirable side-effects of the drug, such as abdominal discomfort thirst, flushing, sweating palpitation, and insomnia, sometimes spoiled an otherwise satisfactory result

(*f*) In some cases recovery was only partial as, for example, when headache and vertigo disappeared but nausea remained At other times benzedrine seemed to produce or aggravate headache Occasionally vomiting stopped but a sense of nausea persisted

(*g*) The influence of other drugs previously taken by the patient and still likely to be capable of producing some effect was a further source of confusion which made some results appear very doubtful indeed This difficulty applied particularly to proprietary and other remedies of unknown composition

(*h*) Ailments other than sea sickness were present in some cases such were asthma (which may be a vagotonic manifestation) pre-existing gastric disorder, and the morning sickness of early pregnancy

Finally, intrusive psychological factors had to be reckoned with It does not require much experience of sea-sickness to recognize the type of patient who is fatalistically expectant and whose expectations are therefore seldom wrong These cases present a problem which is more than therapeutic in the ordinary sense (Certain cases in the doubtful' category may have been partial failures because one has neglected to pay due attention to the ever present psychological factor, but the primary aim of the investigation was the action of benzedrine)

COPYRIGHT

Another difficulty which is mainly psychological arises with patients unable to converse in English Even with the aid of an accomplished interpreter it is usually impossible to evaluate changes in mood and general sense of well being Psychological influences may be helpful rather than harmful, but such cases also have had to be excluded from records of successful benzedrine treatment Instances of these are the patient who has on a previous voyage derived benefit from benzedrine and swallows it with an access of confidence and the other who, expecting some sort of sedative, quietly turns over and falls asleep

3 *Failures*—There is more to be learned from a critical study of the causes of failure than from the complacent contemplation of success Analysis of the twenty-one cases which failed to respond satisfactorily to benzedrine yields the following conclusions

(i) Most cases of sea sickness being amphotonic—that is, combining both vagotonic and sympatheticotonic elements—benzedrine alone even in the presence of definite signs of vagotonia, is apt to swing the balance towards the other extreme It is best given in suitable combination.

(ii) In some cases of extreme vagotonia, accompanied probably by high sympathetic threshold, the dosage (usually 10 to 20 mg) was apparently not adequate In others there was definite improvement which lasted but two or three hours and might well have been maintained had the dose been repeated

(iii) Insufficient attention was paid to the influence of associated disorders chief among which in this series was constipation a condition interfering very definitely with the process of adaptation Contrary to the findings of Myerson and Ritvo (1936)—in different conditions—most of the cases at present under review appeared to have peristaltic activity either suppressed or delayed

(iv) Resistance to the effects of benzedrine was encountered in only one case that of a woman of 50 Vomiting stopped after 20 mg but no other objective or subjective changes were apparent nausea and vertigo persisted These symptoms finally disappeared after two further doses of 30 mg. each when the first complaint of headache was recorded and there was slight interference with sleep Twelve hours later no evidence of any benzedrine action could be found and the patient appeared to have made a spontaneous recovery It is fortunate in dealing with such cases that even if the effects of benzedrine are wholly bad they are not long continued From laboratory investigations reported through the courtesy of the manufacturers Messrs Smith Kline and French (1937) it appears that the drug is fairly readily destroyed in the body

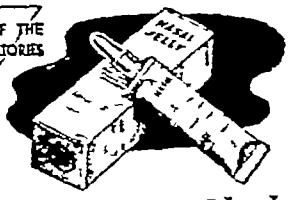
(v) In ten cases the results were unsatisfactory but none of the above causes supplied any explanation The average age of these cases was 46 exactly ten years more than the average for the series Although the circulatory changes could not be distinguished clinically from those of the remainder it may be that after 45 there is a tendency for undesirable pressor or other effects to be produced

General Commentary

A study of the data provided by the cases here described yields two interesting generalizations regarding the action of benzedrine (1) When euphoria has resulted the subsequent depression is insignificant in degree and duration compared with the preceding exaltation probably the reaction coincides with the period of sleep (2) The effects appear very rapidly but are long-continued as if a succession of interdependent physiological changes had been initiated by the action of the drug The rapid effect on gastric spasm suggesting a local action is obviously of great value in sea sickness It is certainly remarkable how seldom benzedrine is vomited even by patients who have openly despaired of being able to retain it.

Enthusiasm for a new drug must be tempered with sound scepticism and the results scrutinized with care These conditions granted, there is still reliable evidence that benzedrine is a valuable aid in the treatment of certain types of sea sickness It is not a rival to old-established methods but a useful ally The effect is greater and more lasting when benzedrine is combined with other remedies, because cases of sea sickness seldom fit conveniently into the twin pigeon holes of vagotonia and sympatheticotonia the majority show features characteristic of each Further the effect is augmented by the vagus inhibiting properties of belladonna *et hoc genus omne* while in the presence of concomitant sympathetic activity bromides or barbiturates prevent unpleasant restlessness and insomnia without, apparently, interfering with the gastro intestinal or circulatory effects of benzedrine

For the suppression of sympathetic activity, especially that associated with dread of sea sickness bromides rank high Combined with chloral hydrate they produce results not yet surpassed by any of the more elegant products of the modern pharmaceutical laboratory An effective method of administration, favouring retention and absorption, is



Sodium bromide	60 grains
Chloral hydrate	30 grains
Spirit of chloroform	q.s
Water to one ounce	

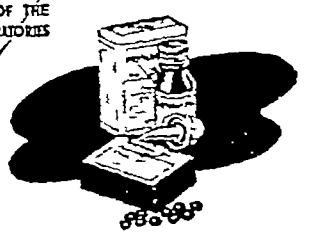
Of this the dose is one teaspoonful every half hour Before there is any possibility of overdosage the patient drops off to sleep and thereby lengthens the intervals Coincident vagal activity may be controlled by belladonna or counteracted by the sympathicotropic action of benzedrine of which 10 or 20 mg may be incorporated in the first ounce of mixture Thereafter the dosage and intervals should be adjusted to meet the needs of the case Benzedrine is best omitted in the late afternoon or evening, as its stimulant effect is usually prolonged even 60 grains of bromide will sometimes fail to prevent insomnia The slow elimination of bromides is sometimes quoted as a drawback to their use But in the not infrequent case of sea sickness where unpleasant after-effects are apt to continue for a time on land this objection may be discounted Even in protracted sea sickness it is exceedingly unlikely for bromism to develop If the patient fails to respond to the treatment suggested above, the case should be carefully reviewed before any other sedative drugs are given

Advantages and Disadvantages of Barbiturates

The main advantages of barbiturates are that they are more palatable and convenient and more rapidly excreted The latter property is advantageous in short crossings where only a brief action is desired Those members of the group which find favour as hypnotics are eliminated more rapidly than those used as general nervous sedatives The action of sodium amytal for example is usually too evanescent for the ordinary case of sea sickness The same is true of its isomer nembutal and of evipan and pentothal A more prolonged effect follows the use of dial Luminal is excreted still more slowly Elimination of barbitone itself (veronal) is slower than that of any of those mentioned It is not free from the danger of cumulative action In common with most, if not all of its derivatives barbitone in repeated doses is apt to produce toxic effects on liver and kidneys In view of the liability to ketosis in sea sickness this is a danger to be carefully considered When barbiturates are given for the control of motor excitability possibly aggravated by benze-

PRODUCT OF THE GLAXO LABORATORIES

An Antivirus to Check Nasal Congestion and Catarrh



ANTIVIRIN NASAL JELLY can be rapidly effective in clearing up head-colds, nasal congestion and catarrh. The jelly contains sterile detoxicated filtrates of the organisms generally found in the naso-pharynx in cases of the common cold. It prevents the multiplication of these organisms, and stimulates the resistance of the tissues to their effects. 1% ephedrine hydrochloride is also incorporated. Antivirin Nasal Jelly is sufficiently viscous to penetrate the folds of the mucous membrane.

ANTIVIRIN

NASAL JELLY

In long nozzle tubes 1/6 (except I.F.S.). Subject to usual professional discount.

PRODUCT OF THE GLAXO LABORATORIES

Rapid Saturation

Rapid saturation of the body with vitamin A has, in many cases, achieved a dramatic increase in the natural powers of resistance to infection.

drine it is well to remember that this action is more marked (Hale-White, 1935) in those which have the ethyl group, C_2H_5, replaced by phenyl, C_6H_5, examples of this molecular construction are luminal, prominal, and nirvanol It might be desirable in certain cases to combine a quick-acting sedative with one more slowly absorbed but having a more prolonged action In this connexion it should be recalled that luminal sodium is incompatible with chloral hydrate or any salt of ammonium

Two disadvantages of barbiturates are (1) the occasional occurrence of idiosyncrasy, and (2) the narrow margin of safety with full doses Mutch (1934) gives the following ratio M L.D /M Th D for luminal, 1 3, barbitone, 1 6, soneryl, nembutal, and phanodorm, all 2 4, dial, 2 5, evipan, 5

Addiction to Benzedrine

Recent publicity has given prominence to the fear that some may learn to partake too freely of benzedrine But Guttmann and Sargant (1937) and Wilbur and others (1937) have shown that the ecstasies fade with repetition It is the unstable neurotics who need to be kept from drugs of addiction These unfortunates, being at discord with life, crave one thing above all others—oblivion The fact that benzedrine robs them of sleep will quickly make it unpopular

Summary

1 The clinical effects of benzedrine (beta-phenylisopropylamine) sulphate on twenty adults in normal health have been studied, with special reference to changes in pulse rate, blood pressure, and subjective sensations

2 One hundred cases of sea-sickness treated with benzedrine, alone or combined, are classified according to results

3 Benzedrine has great possibilities of usefulness in certain cases of sea-sickness in which there are signs of excessive vagus activity

My thanks are due to Sister Hilda M Smith for much valuable help in collecting data for this paper

G Ferrari (*Rif med* August 14, 1937) states that though the risks of pneumoperitoneum are almost negligible provided proper precautions are taken, a number of serious cases have been recorded in which infection of the peritoneum, haemorrhage, puncture of the intestine, emphysema, and embolism have taken place He records one case of a man aged 31 who suffered from bronchiectasis complicated by haemoptysis Pneumoperitoneum was carried out as a haemostatic measure and the haemorrhage, which had been refractory to drug treatment ceased Four days later however the patient developed lobar pneumonia complicated by a pulmonary abscess

A CRITICAL SURVEY OF 349 CASES OF BREECH DELIVERY*

BY

C. H G MACAFEE, M.B, F R.C S Eng, F.R C S I., F C.O G

AND

H I. McCLURE, M B, B Sc., F R C.S Ed, M.C.O G

In reading the published results of breech delivery from a variety of sources we have been struck with the marked disparity in the foetal mortality rates The recorded figures are so much at variance and some of them are so alarming that we decided to investigate a series of consecutive breech deliveries occurring in the Royal Maternity Hospital, Belfast, during the years 1932–6 This paper is based on a review of 349 consecutive cases These cases represent a frequency of 6 03 per cent of all deliveries occurring in the hospital over the same period In reviewing 638 of our own private cases we found the frequency to be 2 5 per cent Of the 349 cases 305 were primary breech presentations Three hundred and thirty two mothers were delivered of 349 babies—that is, there were seventeen cases of twins in which each child was delivered as a breech The mothers have been classified into four groups as shown in Table I

TABLE I—*Classification of the 332 Cases*

	Primigravidae	Multigravidae
Ante-natal	67	135
Emergency	48	82
	115	217

With the exception of three cases in which Caesarean section was performed delivery was effected by the classical methods We wish, however, to draw attention to the fact that the deliveries were carried out by various members of our resident medical staff, and do not represent the results which might be obtained in a series of cases dealt with by an individual obstetrician

In assessing the results of breech delivery, in our opinion undue stress has been laid on the so-called "complicated breech In this paper we define a complicated breech as one where there exists an additional risk to the life of the foetus—for example, placenta praevia, contracted pelvis, or marked prematurity Provided that adequate management is available we do not regard extension of the limbs as a complication Extension of the legs, in our experience, is the rule in primigravidae We at once admit that extension of the limbs adds to the difficulties of delivery, especially in a primigravida, but a mother must be a primigravida at some stage in her career, and therefore the term "breech with extended legs in a primigravida" cannot, in our opinion, be regarded as a complicated breech Published statistics of foetal mortality in breech presentation vary from 30 per cent to 8 6 per cent in primigravidae—for example, Gibberd (1931) gives a gross mortality of 30 per cent and a corrected mortality of 28 per cent The gross uncorrected foetal mortality in our series was as follows

TABLE II—*Gross Foetal Mortality*

	Babies Born	Babies Born Dead	Percentage
All cases	349	118	33 8
Primigravidae	118	28	23 72
Multigravidae	231	90	38.96

THE EARLY DIAGNOSIS OF PULMONARY TUBERCULOSIS *

BY

GEOFFREY MARSHALL, M D , F R C P

Physician Guy s Hospital Assistant Physician Brompton Hospital

This is a subject which some of us have used for lectures to undergraduates and discussions with our colleagues for many years As personal experience has grown the difficulties of the problem have become exemplified and tendencies to dogmatic statement curtailed As in other troublesome problems of medicine, the brunt of it falls on the general practitioner , and in this he has our lively sympathy and our willing co-operation When the patient comes to the specialist it is usually because there has been some conclusive symptom or because an examination of the sputum or an *x* ray photograph of the chest has established the diagnosis If then the relatives ask the consultant to support their indignant criticism of the practitioner for failing to diagnose the condition at an earlier date he may well point out to them how complete the absence of all evidence of the disease might have been a few months or even a few weeks previously Well-informed laymen may complain that a practitioner when consulted in a case of suspected tuberculosis did no more than make a physical examination of the patient, and took no steps to obtain bacteriological examinations of the sputum, a record of the temperature range and a skiagram of the chest If it were true that a suspect of tuberculosis had been acquitted on such slender grounds their criticism would be well founded, and an action for negligence might be difficult to defend In years gone by I have heard physicians state that they could diagnose pulmonary tuberculosis in its earliest stages by physical examination of the chest At the time I received the statement with scepticism, and now I know that it deserved flat disbelief No special skill of eye or ear or hand will enable any individual to detect the earliest lesions of tuberculous disease in the lungs or warrant him in excluding the disease without further investigation and a period of observation. In a few exceptional cases I have found physical signs of the disease before any other positive evidence was obtainable but in reviewing any large number of cases one is forced to the conclusion that in early diagnosis the method of physical examination alone would be completely unreliable it is a broken reed

have been speaking of *physical* examination and the same strictures would not so completely condemn a proper *clinical* examination which would include a careful inquiry into family contact and personal history and a painstaking elicitation of symptoms This should bring a much better catch into the net

Early Symptoms

Most of the symptoms in the earlier stages of the disease are those of toxaemia and many of them are not specific They are fatigue loss of morning appetite, loss of weight, and psychological disturbances which are often described as neurasthenia or as a nervous breakdown In young women another common toxaemic symptom is amenorrhoea This symptom in a young girl may arise from a variety of causes two causes which must always be considered are tuberculosis and pregnancy The more specific symptoms are cough, expectoration night sweats, and haemoptysis Any one of these symptoms in an adolescent or a young adult should arouse suspicion and several of them in combination would go far towards clinching the diagnosis There is one symptom which in the absence of all other evidence is in itself diagnostic and that is, a free haemoptysis out of the blue' By this is meant a copious haemorrhage, a cupful or more of bright liquid blood welling up into the mouth in a young subject who has no other symptom or sign of disease Is there any cause for such an occurrence other than an acute tuberculous lesion of the lung? If there be some other cause in an apparently healthy person I have not met with it In such a case announce the diagnosis and order your patient to bed for two months on the spot Do not wait to investigate, for such haemorrhages often occur at such an early stage that all investigations prove negative In the meantime you may lose control of the treatment, and the patient may not come back to you until months later, when the disease has become firmly established and perhaps incurable

Early Complications

We are sometimes enabled to diagnose the disease at an early stage because of the occurrence of complications that are apt to develop before the focus in the lungs has attained a size which renders it liable to detection The more common of these complications is a sterile pleural effusion, and it is not necessary for me to insist that such an effusion, in the absence of evidence of malignant disease is diagnostic The less common and less universally recognized of these early complications is perianal fistula This lesion is so frequently followed by manifest tuberculosis of the lungs that I believe its diagnostic significance is little less than that of the pleural effusion

Investigations

Many cases are submitted to us in which the diagnosis cannot be established by the history symptoms signs or complications but we dare not in any case give a negative diagnosis without investigation What are the methods of investigation we should employ?

First in importance comes examination of the sputum if there be any If there be none, then the patient should

* Read in opening a discussion in the Section of Tuberculosis at the Annual Meeting of the British Medical Association Belfast, 1937

Table III shows the rates for ante natal and emergency cases

TABLE III—*Gross Foetal Mortality*

	Babies Born	Babies Born Dead	Percentage
Ante natal primiparae	70	11	15 71
Emergency "	48	17	35 42
Ante natal multiparae	145	43	29 66
Emergency	86	47	54 65

In order to obtain the corrected foetal mortality rates we have eliminated those cases in which the death of the foetus was not primarily or directly due to the breech presentation—that is where another factor was responsible such as placenta praevia or marked prematurity Of the total number of babies born—namely 349—118 were born dead For the purpose of computing the mortality rate for which the presentation was directly responsible we have eliminated 103 cases of foetal death, as shown in Table IV

TABLE IV—*Cases Eliminated to Obtain the Corrected Foetal Mortality*

	Ante-natal		Emergency		Total
	Primi parae	Multi parae	Primi parae	Multi-parae	
Macerated foetus	1	12	3	8	24
Version for placenta praevia	—	5	1	17	23
Hydrocephalic monsters	1	3	2	3	9
Anencephalic monsters	2	5	1	—	8
Placenta praevia foot extracted (primary breech)	1	1	—	4	6
Spontaneous prematurity	1	4	—	1	6
Albuminuria induction of premature labour	—	2	—	3	5
Accidental haemorrhage	—	1	—	2	3
Version for prolapse of cord	—	1	—	2	3
Albuminuria spontaneous prematurity	—	—	2	—	2
Version for placenta praevia and prolapse of cord	—	2	—	—	2
Version for neglected shoulder	—	—	—	2	2
Version for transverse lie and prolapse of cord	—	1	—	1	2
Albuminuria hydramnios, and contracted pelvis	1	—	—	—	1
Version for brow presentation	1	—	—	—	1
Eclampsia induction 34 weeks	—	—	1	—	1
Albuminuria and version for transverse lie	—	—	—	1	1
Version during induction for heart disease	—	—	—	1	1
Pyelitis of pregnancy spontaneous premature labour 32 weeks	—	—	—	1	1
Albuminuria previous stillbirth	—	1	—	—	1
Spontaneous prematurity at 32 weeks and prolapse of cord	—	—	—	1	1
Totals	8	38	10	47	103

If we eliminate these 103 cases both from the total number of babies born—namely 349—and from the total number of babies born dead—namely 118—we find that of 246 babies born in fifteen the presentation was responsible for the death of the foetus The corrected foetal mortality rate for which the presentation was responsible was thus 6 10 per cent for all cases Similar treatment of all the four groups of cases described in Table III gives the corrected foetal mortality for each group Table V shows the gross and corrected foetal mortality rates for all group

It will be seen that the corrected foetal mortality for primiparae is 10 per cent and for multiparae 3 42 per cent Three additional facts emerge from Table V (*a*) that the corrected foetal mortality rate in primiparae admitted as emergencies is almost four times as great as that in primiparae who had received adequate ante-natal supervision, (*b*) that the most common causes of foetal death in multiparae, both ante natal and emergency are to be found in the associated conditions and (*c*) the complicated breech as we define it, is more common in the multiparae Table VI shows the mortality rates of other writers

TABLE V—*Gross and Corrected Foetal Mortality Rates*

Group	Gross			Cases eliminated	Corrected		
	Babies Born	Babies Born Dead	Per cent.		Babies Born	Deaths due to the Presentation	Per cent.
Ante natal primiparae	70	11	15 71	8	62	3	4 84
Emergency primiparae	48	17	35 42	10	38	7	18 42
All primiparae	118	28	23 72	18	100	10	10
Ante-natal multiparae	145	43	29 66	38	107	5	4 67
Emergency multiparae	86	47	54 65	47	39	0	Nil
All multiparae	231	90	38 96	85	146	5	3.42
Total primiparae and multiparae	349	118	33 81	103	246	15	6 10

TABLE VI—*Foetal Mortality Rates of Various Writers*

Author	Primiparae		Multiparae		All Cases	
	Gross	Corrected	Gross	Corrected	Gross	Corrected
	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent.
Allan (1935)	—	15 6	—	12.3	—	—
Gibberd (1931)	30	28	20	15	—	—
Goethals (1936)	—	—	—	—	26	6.9
Westman (1931)	—	11.2	—	5.2	—	8 8
Bourne (1931)	—	11	—	8	—	—
Pierson (1933)	8 6	8 6	19	13	13	10.8
Macafee and Mc Clure	23 72	10	38.96	3 42	33 81	6 10

These figures show a wide variation but none of these writers enumerated in detail as we have done the cases they eliminated to obtain the corrected foetal mortality rates We have taken the figures they describe as gross and corrected rates from their publications

Maternal Complications

Maternal Morbidity—Nineteen mothers were morbid according to the British Medical Association standard—that is 5 9 per cent This figure includes five deaths The average morbidity rate for the hospital during the period under review was 6 per cent In none of the patients who died was the presentation *per se* responsible for the fatal issue Two were cases of placenta praevia—one of which ended in death from puerperal sepsis—two of multiple pregnancy and the fifth patient was admitted dying from cardiac failure the result of aortic regurgitation In the remaining fourteen cases the morbidity as due to puerperal sepsis—that is there were in all fifteen cases of puerperal sepsis or 4 5 per cent This is a high incidence of sepsis and is without doubt referable to the increased manipulations required during delivery

be given potassium iodide or ammonium carbonate in 10-grain doses until expectoration is provoked The sample so obtained may be poor thin stuff, devoid of pus, and the pathologist may regard it with contempt and doubt whether it be worth the trouble of staining Give him courteous encouragement, for tubercle bacilli have been found in many such unpromising specimens One negative result is of no significance, but indicates the need for two further samples to be submitted In many cases three negative results must be regarded as inconclusive, and then recourse is had to a more searching test than that of microscopical inspection of a stained smear Until recently the test favoured has been injection into a guinea-pig, followed six weeks later by killing and necropsy of the animal for evidence of tuberculous inflammation of the lymph glands draining the site of injection Objections to this method are the long period involved before the test can be completed, and the proneness of captive guinea-pigs to sudden and premature demise, which may remove them from the scene before the test is complete, but when several weeks have been wasted in fruitless waiting The guinea-pig is therefore being supplanted by cultivation of the sputum for tubercle bacilli on special media such as that of Loewenstein If bacilli are present, colonies usually develop within fourteen days, and the proportion of positive results is little if at all inferior to that obtained by animal inoculation

After examination of the sputum for tubercle bacilli the investigation next in importance is the taking of an x-ray photograph of the chest The improved definition obtained in recent years by exposures of a fraction of a second has greatly increased the diagnostic value of radiography of the lungs It is unnecessary for me to deal with the details of this subject, but I should like to reiterate that the value of the method must depend ultimately on the knowledge and experience of the man who interprets the appearances seen on the screen and film The wise physician will view and discuss these appearances with the radiologist, the wise radiologist will leave the responsibility of diagnosis to the physician

The third form of investigation which we commonly employ is a diurnal record of the temperature Satisfactory readings can be obtained with a calibrated 'half-minute' thermometer kept in the closed mouth for three minutes In a case of early tuberculosis, when the patient is up and about, we shall generally find an abnormal range, the morning readings being unusually low and the evening readings above 98·4° F It must be remembered that in young women the temperature commonly rises to 99° or over during the week preceding the menstrual flow, even in perfect health

These three methods of investigation—examination of the sputum, radiography of the chest, and recording of the temperature—are a necessary part of our technique in diagnosing pulmonary tuberculosis in its early stages, but there are other investigations which some of you will have in mind First there are the various tuberculin tests—cutaneous, subcutaneous, or conjunctival These tests are still held in great respect by our veterinary colleagues and by those of our legislators who supervise the production of the milk supply The result of a tuberculin test decides the question of life or death in the herd of an attested dairy farm It is fortunate that the human species is not subject to the same dubious regulation, for it would involve the slaughter of some 80 per cent of the adult population of these islands There is overwhelming evidence that a positive tuberculin test indicates sensitivity to tuberculin, and that it signifies that the individual has probably at some previous period been infected by and acquired some immunity to tubercle bacilli, but it is no evidence at all that the individual is suffering from tuberculous disease, except in the case of infants

Another type of investigation depends on examination of the blood Many attempts have been made to devise a satisfactory complement-fixation test, but up to date none have gained a reputation for reliability On the other hand the erythrocyte sedimentation rate, the Arneth-Von Bonsdorff nuclear count, and the lymphocyte-monocyte ratio have been found of real value in assessing the progress and severity of tuberculous disease Most of us must, however, agree with Professor Lyle Cummins (1933) when he says that they are of little value in diagnosis

In our routine diagnostic investigations we are therefore reduced to the three which I mentioned first sputum test, x-ray photograph, and temperature record Of these the sputum test, when positive, is the most conclusive I have seen a few cases in which tubercle bacilli were demonstrated in the sputum many weeks before expert and repeated radiographic examinations were able to demonstrate any lesion in the lungs Such cases, however are exceptional, moreover, in many early cases no sputum is obtainable In the early case not only may there be no sputum, there may be no symptoms of any kind This leads me to the final point of my contribution to this discussion Early diagnosis is impossible if the victim does not come under medical observation at the appropriate time Not long ago I saw a young man who was working hard for an Honours degree at one of our older universities He had had cough, expectoration, and night sweats for twelve months before he consulted a medical man He was then found to have tuberculous cavitation of both lungs In that case the patient and his friends were deserving of blame

The public is being educated with regard to symptoms which should cause them to seek expert advice but that is not sufficient, for there are cases in which the disease may be detected before the individual has any warning of an impending disturbance of health We have learned this from the careful investigation of apparently healthy contacts living in the same house with a sufferer from open tuberculosis The lesson is driven home by investigations such as those of R C Wingfield and Margaret Macpherson (1936) They took x-ray photographs of the chest in 2,381 adolescents employed in factories and shops, The material consisted of apparently healthy subjects between the ages of 14 and 21 By this method they discovered that about one in every hundred had tuberculous lesions in the lungs Similar investigations in other countries have resulted in the finding of latent pulmonary tuberculosis in from 1·5 to 3·9 per cent of supposedly healthy adolescents Some of our larger hospitals are now carrying out a similar radiographic examination of their nurses and medical students At each such institution unsuspected cases of active tuberculosis have in this way been detected The day may come when it will be possible to take an annual x ray photograph of the chest of every young person from the ages 14 to 24 and a big step will have been taken towards the early diagnosis and the eradication of pulmonary tuberculosis In the meantime let us press for the application of this system where it is most needed—amongst the nurses and students at our hospitals, the students at our universities and the factories which employ the young girls of whom this disease takes so large a toll

Post-partum Haemorrhage—This complication occurred in eleven cases (3 3 per cent) Two of these patients died

Complete Perineal Laceration—This occurred on four occasions (1 2 per cent), all the patients were primigravidae

Management of the Breech Presentation

It is evident from the foregoing tables that the results of breech presentation, while not so alarming as some writers indicate, show foetal mortality rates of 6 10 per cent for all cases and 10 per cent. for primiparae, yet we are definitely of the opinion that there are certain essential precautions which should be taken to reduce this figure still further

Obviously in the short time at our disposal only the outstanding features of the management can be discussed

First and foremost is ante natal care, and this resolves itself for the present purpose into the practice of external version At any stage after the thirtieth week of pregnancy external version should be performed in all primigravidae as soon as the breech presentation is discovered The likelihood of failure increases with the approach of term on account of the increasing size of the foetus and the tendency to fixation of the presenting part

We are of the opinion that in multiparae the presentation should be corrected, if possible, not later than the thirty-fourth week We at once admit Dearnley's (1931) contention that spontaneous version to a vertex presentation occurs in a large percentage of cases at about the thirty-fourth week to the thirty-fifth week of gestation, but as yet we have discovered no method of diagnosing the case in which this is going to occur Once version has been successfully performed the patient should be re-examined every week until the onset of labour This is specially indicated in multiparae, in whom we have found it necessary to correct the presentation on several occasions In 134 patients upon whom we performed this manœuvre one foetus was born dead, its death being directly due to the version—a foetal mortality rate of 0 74 per cent The experience of other writers is given in Table VII

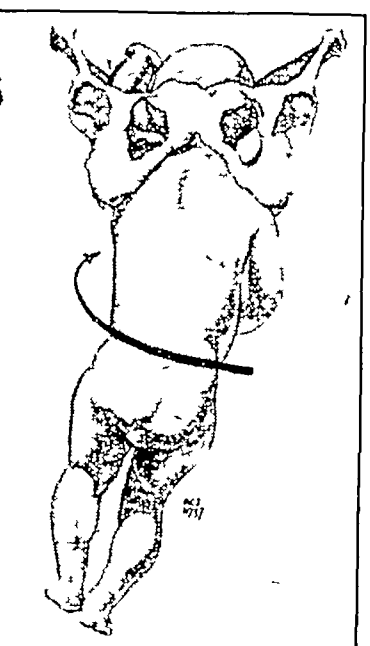

TABLE VII—*External Version*

We consider that external version should be performed with the greatest gentleness An anaesthetic should not be administered lest undue force be employed, resulting in separation of the placenta a complication we have witnessed The so called 'light anaesthesia' advocated by some writers is of little value, as sufficient relaxation is not obtained We have found the Trendelenburg position to be of great assistance and it has enabled us to perform external version in cases where the legs have been extended

Attempts at version should not be continued in the presence of convulsive movements of the foetus since these indicate serious foetal embarrassment Marked slowing of the foetal heart is another indication to desist The risk of the onset of premature labour is slight One of our successful versions was followed by slight ante-partum haemorrhage and the onset of labour twenty hours later The child was born alive As regards delivery, we would stress the importance of the policy of non-intervention until the breech has ceased to advance Any alternative measures at once come under the heading of meddlesome midwifery

In the vast majority of cases the breech advances until it reaches the pelvic floor even though the legs be extended In the light of our experience we must disagree

TREATMENT OF ACQUIRED DEFECTS OF THE SKULL

BY

J HOGARTH PRINGLE, F R C.S.
Consulting Surgeon Glasgow Royal Infirmary

If one may judge by the paucity of literature on the subject the treatment of defects in the vault of the skull does not seem to have been of interest to British surgeons A search through the *Index Medicus* has resulted in finding references to only two papers, both of which appeared in the *British Journal of Surgery* (vols 3 and 4) Yet these holes in the skull may be associated with symptoms of much concern to the patient, arising from brain complications—the result of the injury In their slighter forms they show as headaches, giddiness, mental depression inability to concentrate, and want of confidence any or all of these being no doubt influenced by the constantly obvious hole through which the pulsating brain can in many instances be observed while some of the patients who before their injury never had any trace of nervous disease may become subject to epileptiform seizures

Operation for the repair of these defects affords an opportunity whereby the patient may be really greatly benefited, so that these injuries offer an interesting field in surgery Too many patients suffered from war wounds that terminated in this way, and it is remarkable that so few reports of operation for the condition have been published and that none can be found recording the late results of any operative treatment

In civilian practice open fractures of the skull are probably the most frequent cause, very much more rarely a hole is left after a portion of a bone, the seat of a neoplasm, has been removed In early life contusion of skull bones with or without a fracture may in rare instances be followed by more or less extensive absorption of bone and it occasionally leads to the development of a traumatic cephalhydrocele (*Edin Hosp Reports* 3, 562)

When dealing with closed fractures of the skull that require operation it is probably the custom of most surgeons to replace any bone that is removed—for example trephine disks, loose fragments in depressed fractures, etc—as suggested and practised by Sir William Macewen In the majority of cases the reimplanted bone forms osseous union frequently only by interrupted bridges but strong enough to give good protection to the brain but it is unusual for reimplantation of bones to be followed by fibrous union

With open fractures it is often a matter of greater difficulty Many of the patients who sustain these injuries in civilian life have the entire wound thoroughly ingrained with extraneous dirt not only the surface of the scalp wound but the bone surface and even the brain itself may be thus contaminated as well as by sebaceous material hairs etc from an unclean scalp Cases of this type offer as good a test of one's ability to make a wound aseptic as can be found in the whole field of surgery but when thoroughly dealt with it is surprising how well they get on and how often healing by primary union takes place In these cases it is the experience of the operator which counts that alone will allow him to decide whether the bone may be reimplanted or not, though the most experienced will occasionally find that there has been a failure to prevent sepsis and that the bone fragments must be removed It must also be remembered that in many cases fractures of the vault are continued down to the base and involve the accessory sinuses connected with the nasal cavities from which infection can spread

Of 115 cases of fracture of the skull under my care that required operation bone was removed temporarily and reimplanted in forty seven Sixteen of these had closed and thirty one had open fractures Of the sixteen with closed fractures three died—two from laceration, etc of the brain, and one from septicaemia following a suppurating parotitis which developed seventeen days after operation The others made good recovery

Of the thirty one patients with open fractures, many of whom had wounds thoroughly ingrained with extraneous dirt, six died of cerebral complications within forty-eight hours The others of this group recovered, in four of them, however, the reimplanted bones had to be removed, three of these because of sepsis, in the fourth patient, who had a deep gutter fracture of frontal bone a trephine disk was required to enable bone to be elevated the two tables of these fragments were completely separated along the diploe Neither the frontal (air) sinus nor the longitudinal (venous) sinus had been injured The trephine disk and the outer table of the fragments were reimplanted and while the latter united well the disk remained movable Nine months later the patient returned complaining of pain in the skin of the forehead on pressure over the site of fracture this was due to a spicule of bone An incision was made and the trephine disk found to be quite avascular and loose The reimplanted fragments of the outer table were firmly united and fixed and the dura mater in the trephine opening had a good layer of new bone covering it in continuity with the margin of the opening

In the case of gunshot wounds of the skull, and particularly in those sustained in the war sepsis of a severe degree occurred in all of them, resulting in a prolonged convalescence, and all wounds of this type that healed did so with more or less extensive adhesions between brain and scalp In many instances no real scalp existed at the wound, the cerebral cicatrix being covered merely by a thin layer of epithelium, intimately adherent to it, and of course immobile upon the brain below

It is not good that a man should have his brain anchored to his scalp and perhaps this is more important in wounds at the Rolandic and frontal areas These are the cases associated particularly with cerebral symptoms which may be another reason for operative treatment in addition to that of filling up the opening in the skull

There are various methods by which these openings may be closed They are either autoplastic or heteroplastic Of the autoplastic methods the König Müller operation does not appear to have been adopted in this country to any extent It has never appealed to me, and I have never seen any patient who had been treated by it

In some situations where there is a large gap to be filled in it may be impossible to cut an intact bone flap, and in most cases, owing to the convexity of the skull the best that can be done is to produce a tessellated layer of bone scales The method is not adapted for cosmetic purposes on the forehead The extent of wound produced by the formation of the two flaps required is no great advantage The use of bone, or cartilage, transplanted from a distance has its advocates It means an additional wound and a rough irregular, freshly cut surface in the case of bone that might lead to the development of irregular spicules causing irritation either of the brain or of the scalp (see above)

with Bourne (1931) who states "that if the legs are extended they should be brought down at the beginning of the second stage of labour, except the child be so small that no obstruction be anticipated I believe that it is wise to bring down at least one leg and often two, depending on the size of the baby, in all cases as early as the os will conveniently and safely admit the hand This practice may be reasonably safe in the hands of an experienced obstetric surgeon, but if generally adopted it must add considerably to foetal and maternal risks We extract legs only under the circumstances mentioned above—that is, when the breech has ceased to advance An episiotomy should always be performed as a preliminary step in primigravidae and if necessary, in multigravidae

In nearly every case where the legs have been extended it is found that the arms are also extended In bringing down the posterior arm we adopt the classical method but we fail to agree with the usual instructions of standard textbooks regarding the method of dealing with the anterior arm For example Solomons (1928) and Munro Kerr (1916), to mention only two authorities, advise that if the anterior arm cannot be brought down easily as an anterior arm the child's back and occiput should be rotated across the hollow of the sacrum As we will point out the foetus is thereby forced to retrace a portion of the arc it has already traversed naturally We find almost invariably that these instructions are not only unnecessary but add greatly to the difficulty Before extraction of the posterior arm it will be found that the foetus is lying with the bisacromial diameter in the antero-posterior diameter of the pelvis (Fig 1) When the posterior arm has been extracted two changes occur (1) the foetus descends, and (2) it rotates so that the bisacromial diameter now occupies the transverse or oblique diameter *with the back in front* and the anterior arm lying at the side of the pelvis (Fig 2) From this position the arm can in the majority of cases be easily brought down (Fig 3) In the few cases where there is difficulty the natural rotation of the shoulders should be augmented artificially till the bisacromial diameter occupies the antero-posterior diameter when the arm can be extracted (Fig 4)

Most authorities recommend that the shoulders should be rotated in the opposite direction on account of the risk of the arm assuming the nuchal position This risk is negligible and can be prevented by the operator placing the hand (corresponding to the foetal arm) with the first two fingers extended along the humerus and maintaining pressure during the act of rotation as we have above described it

The great objection to rotating the shoulders in the direction usually advised is that the head may assume the occipito-posterior position Munro Kerr recognizes this risk in his description of the method of rotation to bring the anterior arm into the posterior position and to avoid it advises continuing the rotation beyond the middle line This manœuvre whereby the occiput is rotated posteriorly or the neck severely twisted is dangerous and complicated compared with the safe and simple method we adopt. Apart from extraction in a contracted pelvis, posterior rotation of the occiput gives rise to the greatest difficulty met with in the delivery of the after coming head and is responsible for a high foetal mortality Hence our insistence on the maintenance of the normal mechanism in dealing with the anterior arm No good ever comes from interference with normal mechanism Extraction of the after-coming head is accomplished by the usual methods but we insist on slow and gentle delivery to prevent tentorial tears Holland (1937) has shown that these tears are much more likely to cause the death of the foetus than asphyxia, the excuse for rapid delivery

Summary

1 A series of 349 consecutive cases of breech delivery is reviewed

2 The corrected foetal mortality in primiparae is 10 per cent in multiparae 3·42 per cent and in all cases 6·10 per cent

3 Stress is laid on the value of ante natal version the method of dealing with the anterior arm, and the extraction of the after-coming head

4 There is an increased risk to the mother from puerperal sepsis

We are indebted to Professor C G Lowry and Mr H L Hardy Greer for permission to use the data from which this paper was prepared We have also to thank Mr L A Bullwinkle Registrar General for Northern Ireland and Mr J Scott of his department to whom we submitted the statistics We are also grateful to Dr T S Hall of the Lancashire Public Health Service for his constructive criticism

Vigoni (*Scalpel* Liége, July 31, 1937, p 1095) emphasizes the difficulty of dealing adequately with the numerous cases of tropical ulcer which are so common in certain countries The outstanding features of the disease are the rapid development, the slow convalescence, and the long period of incapacity which follows The ulcer may be pneumococcal in origin or may be due to any one of a variety of microbic organisms Tropical ulcer occurs most commonly on the foot or leg It is first noticed as a small pustule This breaks down leaving a red or brownish ulcer, which extends rapidly downwards and on the surface until it has become of a considerable size and may even cover the whole leg Osteomyelitis of the adjacent bones may be seen, and in some cases the ulcer invades and destroys the tendons on the dorsum of the foot Although in the majority of cases the leg or foot is affected ulcers of this type may also be seen on the arm and back It has been noticed that the lesion is much more prevalent in the wet than in the dry season Trauma followed by infection would appear to be causative and as the native population have no protection for the feet and legs the predilection of the disease for the lower limbs may be accounted for There is no specific medical treatment for tropical ulcer but hospitalization with rest and conditions of hygiene is essential Intermittent irrigation, following the method of Carrel has been found to be of great value as has the use of Dakin's solution Surgical treatment is necessary in those cases in which there is a considerable loss of tissue which must be replaced by a graft Excision followed by suture is only applicable to those ulcers which have a diameter of less than 2 cm Necrosis and recurrence of the lesion are common and infection after excision may occur due to the microbic infection of the primary ulcer Healing is very slow as a rule Operation was carried out in 528 cases with healing by first intention in 337 instances The various operative procedures are described

The ideal operation, in my opinion, is the one that gets a patient well as quickly and as easily and with as little traumatism as possible, and so in every instance of a gap in the skull, both in civil and in military practice, I have employed celluloid for the purpose of filling the gap

Celluloid has one, and only one, disadvantage—it is a foreign substance The qualities which recommend it are many In the first place, unlike almost all the heteroplastic materials that have been employed from time to time, it is not absorbable, then it is easily obtained in plates large enough to fill any of these openings, is easily worked, and can be moulded within certain limits It can be 'splinted' for extra strength or to maintain a definite and desired shape with a second layer, or by strips, of the same material, which, with a proper solvent, become permanently incorporated as a single mass, it is easily sterilizable, it presents an entirely smooth surface to a damaged cortex beneath and a freshened surface of scalp or scar tissue above it, the advantage of this being that the outside covering remains freely mobile upon the plate Celluloid is, moreover strong and resilient and capable of resisting quite a considerable degree of violence (see below) As far as I am concerned my experience in its use is entirely satisfactory, and, what is more, the patients I have seen recently, twenty and more years after their operation, are thoroughly satisfied also

In the *British Medical Journal* of February 3, 1906, I reported notes of six patients for whom celluloid was employed for gaps of various sizes, the largest being 9 × 5 cm Since that date I have only used celluloid for five other patients in civilian practice

After the war began in 1914 eighteen men were admitted under my care at the 4th Scottish General Hospital suffering from gunshot wounds of the skull and brain Two of these men came with large granulating cerebral herniae, the others with their wounds completely cicatrized, leaving more or less dense and extensive adhesions between brain and scalp

Concerning these eighteen men, all of whom had a celluloid plate inserted, eight have been lost sight of (five of them were the subjects of general epilepsy—the result of the brain injury—the fits coming without warning), and it is unfortunate that the later history of these patients is lost The remaining ten I have seen personally during this current year, twenty or twenty-one years after their operation Six of these were suffering from traumatic epilepsy following on their injury when they came under observation Three of them have not been improved so far as the epilepsy is concerned, the fits continue and they have been unable to work since their discharge from hospital In one of these patients the wound was frontal, in one parietal, and in one right parieto occipital with visual aura (flashes of light) preceding the convulsions The fourth patient (with left occipital wound) of this group had many generalized fits with visual aura (flashes of light, revolving like a wheel) He has been free from any major seizure since his operation and has been employed continuously since his discharge but states that at times he still sees the flashing light, which is followed by a 'queer feeling' coming over him (*petit mal*) When this happens he is obliged to cease work for about five minutes, but does not lose consciousness At the end of this time he goes back to a moulding machine in an engineering shop, and is able to take up his work where it was left off He is employed on full wages, so these interruptions cannot be very serious

Of two remaining patients, one, with a frontal wound, had many general convulsions before and several during the early days following his operation, the other, with a wound over the left Rolandic area, was the subject of Jacksonian epilepsy, the fits beginning in the right index finger and usually involving both limbs of the right side These two patients have been entirely free from fits since they were discharged from hospital, they are employed full time on full wages in responsible positions, sums of money passing through their hands

Four men happily escaped the calamity of having epileptic manifestations added to the misfortune of being wounded Three of them have been well in every way since their discharge from hospital and have been employed full time on full wages ever since One (frontal) works in a large explosives factory, one (parietal) is a railway platelayer, one (frontal with a large part of the vertical right frontal bone and the whole of its horizontal plate removed) is in charge of a pumping engine at the waterworks of a large town The fourth man of this group went seven years without any fits after his skull was plated, but at the end of that period developed an abscess, and seems to have had one or two fits The abscess was evacuated, and the plate, a large one, was removed, the wound healed again quickly Two years after this event he called upon me and said that he was very well and had had no more fits, but was not working He produced the plate, which was absolutely intact after its seven years in his head and did not show the least sign of erosion at any point A letter received from him in the spring of this year stated that he was well but still unemployed

In these ten men the "plates" were found to be sound, fitting well, and of good resistance, and with the cutaneous scars freely movable upon them All the men expressed satisfaction with the plates and said they had a feeling of confidence in themselves in consequence of having them

The technique adopted in all these cases has been the same as described in my first paper For an operation in which a heteroplastic substance is to be used the essential factor is to obtain asepsis One may say that where sepsis has occurred after the primary wound, and especially where healing has been by extensive epithelialization of granulations, the longer a patient can be kept between the time of the last granulation being covered and the secondary operation the better All the war cases dealt with had been highly septic, and the plating operation was always deferred till at least six weeks after complete covering had been obtained better still to wait two, or even three months, although while the war was in progress it was not easy to keep the patients so long in hospital These remarks apply equally to the use of completely detached bone or of cartilage It is possible that infection can be better resisted by the bone scales obtained in the König-Müller flap, for they are still in vascular continuity with the soft tissues of the flap

As has been stated, the cicatrix of the scalp was very often of the thinnest description, and the effort was always made to keep this intact by incising through the normal scalp and dissecting the superficial scar as carefully as possible off the cerebral scar In spite of this thinness and the apparently poor blood supply, necrosis of the scar did not occur in any case The brain scar, often very dense and at other times cystic, was excised, and a layer of thin celluloid (actually a portion of a photographic cartilage-film), large enough to extend completely beyond the cut surface of the brain was employed by slipping

THE REQUIREMENTS OF SODIUM CHLORIDE

BY

M A FALCONER, M B, F R C S
Surgical Registrar Aberdeen Royal Infirmary

AND

A LYALL, M D, M R C P
Lecturer in Clinical Chemistry Aberdeen University

(From the Departments of Surgery and Clinical Chemistry in the University of Aberdeen)

A widely recognized complication following the administration of large amounts of saline solution rectally or parenterally is the occurrence of oedema of the lungs or the extremities Coller, Dick, and Maddock (1936) showed that this oedema is the result of the administration not so much of large quantities of water as of excessive amounts of sodium chloride, for the oedema will disappear if glucose solutions are substituted for salt solutions Jones and Eaton (1933) pointed out that a reduction of the protein intake such as occurs in certain gastro intestinal disorders, profuse surgical drainage, the general effects of sepsis, and the loss of serum protein by massive haemorrhage, all lead to a reduction in the serum proteins of the blood There is thus a diminution in the osmotic pressure exerted by the blood colloids, and this diminution probably accounts for the tendency to oedema which arises when the tissue reserves of chloride are raised We have observed that following repeated injections of sodium chloride solution oedema may occur before chloride appears in the urine in more than negligible proportions

Recently Maddock and Coller (1937) have established criteria as to the correct amounts of fluid required by patients at rest, after operation, and in conditions of dehydration We think it advisable to add criteria which we have obtained as to the amounts of sodium chloride required by the body in health and in hypochloraemia

The Basal Requirements of Sodium Chloride

The usual daily intake of 6 to 12 grammes of sodium chloride in an ordinary diet represents an amount in excess of the actual needs of the body, the excess salt being excreted in the urine In order to ascertain the basal requirements of salt we selected three healthy male subjects who were confined to bed because of fractures of the leg For the first three days they were given the usual ward diet Twenty-four specimens of urine were collected and the daily sodium chloride excretion estimated * Blood specimens were collected daily for plasma chloride and haematocrit estimations * Following this control period each subject was given a diet as low in chloride as possible, compatible with ensuring a balanced diet and with using foodstuffs which were readily procurable After six days on this diet alone (salt intake approximately 2 1 grammes daily) the salt intake was increased by the addition of 2 grammes a day for three or four days, and then by the addition of 4 grammes a day for three days

* The plasma chloride (as NaCl) was estimated by van Slyke and Sendroy s method on oxalated specimens of blood which however were not collected under paraffin The same method was used for the urinary chloride The haematocrit estimations were made by means of capillary haematocrit tubes

The following basic salt-poor diet was given to two of the three subjects

		NaCl Content
Brown bread	150 grammes	0 911 gramme
Butter	45 „	0 545 „
Milk	300 c cm.	0 318 „
White fish	100 grammes	0 106 „
Egg	1	0 063 „
Chicken	60 grammes	0 060 „
Tomato	100	0 034 „
Potato	75 „	0 028 „
Cream	30 c.cm	0 024 „
Apple	200 grammes	0 010 „
Orange juice	100 c cm.	0 003 „
Sago	10 grammes	0 002 „
Gooseberry jam	120 „	—
Sugar	45 „	—
		2.104 grammes

This diet contains 189 grammes of carbohydrate, 62 grammes of protein, and 75 grammes of fat, and has an energy value of 1,680 calories and a total sodium chloride content of 2 1 grammes

The findings observed in each of our three subjects are presented in graphical form (Charts I, II, and III) These charts show that, after a diet containing 2 1 grammes of sodium chloride has been taken for six days, the salt excretion falls and is about 2 grammes a day If then salt is added to the diet, the excess salt is excreted in the urine after a latent period of one or two days has elapsed In Chart III it will be seen that cessation of the salt output occurred as the result of an attack of acute tonsillitis on the eleventh day When this attack subsided the excess salt was excreted

We deduced from these observations that for short periods the basal requirement of sodium chloride in health is less than 1 to 2 grammes a day

Requirements of Sodium Chloride in Hypochloraemia

To observe the effects of salt administration in hypochloraemia we chose a number of patients in whom there had been excessive chloride loss following vomiting due to obstruction in the alimentary tract and to whom known quantities of saline were given (with one exception) only by parenteral routes In each case the plasma chloride values were estimated before and after administration, while the urinary chloride output was estimated and found to remain negligible The results are summarized graphically in Chart IV

From this chart it will be seen that in hypochloraemia about 20 grammes (from 15 to 30 grammes) of salt are required on the average to raise the plasma chloride by 100 mg per 100 c cm (from, say, 400 to 500 mg) Marked variations, however, are seen in the responses to saline administration In assessing the significance of these findings it should be remembered that the total amount of sodium chloride normally present in the circulating blood is about 30 grammes, with a tissue reserve of probably double that amount We believe from personal observations (Falconer and Lyall, 1937) that the undoubted benefits of saline administration are dependent more on the correction of the dehydration than on the alteration of the plasma chloride values, and that salt given in normal solution exerts a greater effect on the plasma chloride levels than when given in concentrated solution We have evidence to show that, after the administration of saline chloride may be stored in the tissues and later be used to raise the plasma chloride These observations probably account for the apparent discrepancies seen in Chart IV

ASSISTANT REQUIRED IN COUNTRY practice in Surrey Experienced man unmarried Salary to start £300 a year all found Own car £1 a week car allowance Dispenser kept.—Address, No 8 4 B M A House Tavistock Square W C.1

LONDON

SATURDAY DECEMBER 4 1937

THE MILK PROBLEM

In view of the forthcoming Milk Bill, in which a measure of compulsory pasteurization is promised, a report just issued by the Health Organization of the League of Nations entitled "The Milk Problem"[1] is of unusual interest It was compiled by a number of experts drawn from the agricultural, nutritional, medical, veterinary, economic, and social fields after a tour of inspection in Great Britain Scandinavia, the Netherlands, and Switzerland The essence of the report, around which most of the individual sections are built is the opinion, unanimously expressed, that attempts to increase the consumption of milk must depend for their success on public confidence in the purity of the milk supply The methods therefore of furnishing the public with milk of high nutritive quality, produced under hygienic conditions from healthy cows rendered safe by adequate pasteurization distributed by efficient and scientifically organized firms, and sold at the minimum possible price, constitute the problem which the authors set out to solve In all the countries visited, with the exception of Norway, it was found that bovine tuberculosis is extremely prevalent and that contagious abortion and mastitis are widespread Our knowledge of the incidence of milk-borne disease in man is at present very defective and it may confidently be assumed that the figures we do possess underestimate—sometimes grossly—its real frequency Nevertheless, it is pointed out in the report that in Great Britain during the twenty-four years 1912–35 there were over a hundred outbreaks of epidemic milk-borne disease, affecting about 12 000 persons During the same time about 150 000 persons contracted tuberculosis of bovine origin through the consumption of milk and over 60,000 of them died, while an unascertained number, probably several thousand suffered from undulant fever due to infection with *Br abortus* In Denmark during the three years 1934–6 there were at least nine outbreaks of epidemic milk-borne disease apart from tuberculosis and undulant fever, involving over 10 000 persons

Three main lines of approach towards the provision of a safe milk supply are discussed in the report—namely the control of animal disease the control of the human personnel, and the destruction of pathogenic organisms in the milk by pasteurization or by other form of heat treatment Consideration is given to the various means of controlling animal disease, and the conclusion is reached that, whenever possible, the eradication method should be used The principle of this method consists in the detection and elimination of all infected animals—not merely of those that are obviously diseased—and the building-up of a healthy herd from the young non-infected stock Any campaign to eradicate animal disease should be carried out with State aid in the economic interests of the farmer on the assumption that a healthy herd is more profitable than a diseased herd Bonus payments to the producer of milk from disease-free herds afford an excellent stimulus to the farmer, but on no account—and this point is strongly emphasized—should the conduct of the campaign be made contingent on the payment by the consumer of a higher price for milk from such herds The amount of animal disease is so extensive, and the difficulties of combating it are so great that its control, however desirable on economic grounds cannot be regarded as affording an immediate solution to the public health problem of protecting the consumer against the risk of milk-borne disease Medical inspection of the personnel is considered to be too expensive and inefficient to be justifiable, except in certain circumstances and in these it is highly recommended When for instance, the milk is to be drunk raw, medical and bacteriological control of all persons handling it in the course of its production and distribution should be insisted upon A similar control should likewise be exercised over all human operatives in pasteurization or other plants in which large volumes of mixed milk are being handled, so as to prevent any possible danger of contamination of the milk after processing This is an extremely important requirement that has so far been largely neglected Even if produced from healthy animals milk is so liable to contamination from human and other sources that the only satisfactory method of ensuring its final safety when delivered to the consumer is to submit it to some form of heat treatment that can be relied on to destroy any pathogenic organisms which may be present

"*It is our considered and emphatic opinion that all liquid milk for human consumption should be adequately pasteurized or boiled* This conclusion which is expressed in italics, will undoubtedly command the support of educated medical opinion

Discussion

In the production of oedema following the administration of large quantities of saline the efficiency of the kidneys plays an important part, for when the renal function is good the kidneys can excrete chloride in the urine in high concentration and so mitigate the possibility of oedema Very rarely, however, does the urinary chloride concentration approach to that of normal saline, and it is therefore inadvisable in the absence of hypochloraemia to tax the kidneys by the administration of such large quantities of salt as are included in 3,000 to 4,000 c cm of normal (0.9 per cent) saline Such amounts of solution contain from 27 to 36 grammes of sodium chloride, in contrast to the basal requirement of less than 2 grammes, the ordinary daily intake of 6 to 12 grammes, and the total chloride content of the body in health, which is about 90 grammes

In administering salines, rectally, parenterally, or by jejunostomy, two factors must be considered—the need for fluid and the need for salt The first of these is well discussed in a recent paper by Maddock and Coller (1937) An average patient requires at least 2,500 c cm of fluid daily in order to ensure an adequate urine output of from 1,000 to 1,500 c cm If dehydration is present this intake should be increased to 5,000 c cm, or even more As a general rule as much fluid as possible should be taken by mouth and the balance given rectally or parenterally In all cases the urine output should be recorded, and when it reaches an adequate level the administration of fluid should be curtailed

The need for salt arises when hypochloraemia is present, as after profuse vomiting in diarrhoea, or after loss of large quantities of fluid by gastric aspiration or via intestinal fistulae In such cases sodium chloride is necessary in amounts varying from 15 to 20 grammes daily, and may be given as 1,500 to 2 000 c cm of 1 per cent solution or in larger amounts of more dilute saline Any additional fluid required may be administered as water by mouth or by rectum, or as 5 per cent glucose solutions rectally or parenterally Such amounts of salt as we recommend are adequate to correct chloride deficiency, and contrast with the basal requirements of less than 2 grammes and the usual intake of 6 to 12 grammes In order to obviate the risk of oedema the plasma chloride should be estimated at least every second day, and when it approaches to 550 mg per 100 c cm the salt intake should be restricted and should not exceed 10 grammes (1,000 c cm of 1 per cent solution) a day

We wish to thank Professor J R Learmonth for his help and encouragement Mr F K Smith senior surgeon to the Royal Infirmary for permission to use his cases Sister Thomson dietitian to the Infirmary for diet sheets, Sister Stephen of the metabolic ward for the meticulous care with which she looked after our cases and James Ellice for technical help

A further gift of £50 000 has been made by Mr John A Dewar to the Gordon Hospital for Rectal Diseases Vauxhall Bridge Road, London Mr Dewar had already given £80,000 for the erection of two new blocks of wards and his latest gift will enable the old part of the hospital to be reconstructed and thus increase the original accommodation threefold

SERUM TREATMENT OF TYPHOID FEVER*

BY

C J McSWEENEY, M D, F R C.P I, D P H

Medical Superintendent Cork Street Hospital Dublin

In May, 1935,[1] I published the results obtained when eight bacteriologically confirmed cases of typhoid fever were given an "anti-Vi" and "anti-O" serum prepared by Dr Felix at the Lister Institute These results, while insignificant statistically did suggest that in this new serum we had a remedy of definite value in relieving the toxaemic symptoms of typhoid fever and worthy of further trial In the present contribution I propose very briefly to review our experiences to date with the Felix serum

In all, sixty-one cases of typhoid fever admitted to Cork Street Hospital since September, 1934, have received serum treatment Every case included was bacteriologically confirmed—if not by blood culture, by unequivocal serological findings Since my original paper was published we have ceased to give serum to mild cases of typhoid, and therefore cases of this type are excluded from this survey, as are, of course, all paratyphoid infections

Results in Sixty-one Cases Receiving Serum (September 1934 to July 1937)

Serum effect excellent	23
Serum effect good	21
Serum effect doubtful	7
Serum effect absent	10
	61

The usual route of administration followed was intramuscular, but the intravenous route has been adopted in some very toxic cases, and the intrathecal in cases presenting meningeal symptoms The dose given has varied from 15 or 20 c cm to 33 c cm, the latter amount being usual for adults Serum is given on three successive days In this series of sixty-one cases there were ten deaths, but it is hardly necessary to point out that a fair comparison of the mortality rate for serum-treated cases with the usual mortality rate for typhoid is not possible because of the fact that the serum treated cases represent a selected group—that is, were given serum because they were toxic or otherwise seriously ill

To begin with the debit side of the balance sheet—the ten deaths three of these were due to perforation One of the patients was actually the first case in the series, and he had had what we now know to have been a very inadequate dose of serum—a single injection of 10 c cm The second perforation was in a woman whose typhoid was complicated by a septic abortion The remaining case perforated two days after the third 25 c cm of serum was given, and the course of the illness seemed to have been uninfluenced by specific therapy A fourth death occurred in a case of haemorrhagic enteric beginning with nephritic symptoms This patient's blood culture was positive for *B typhosus* very early in the disease, and she bled extensively from mucous membranes and into the skin Because of a temporary shortage of supplies she received only half the usual adult dose of serum While admitting a doubt as to whether any treatment would have saved her life, I ought to say that the only other haemorrhagic case of enteric included in this survey recovered dramatically after adequate serum treatment Two other fatal cases were interesting, in that

in this country The various types of pasteurization are defined and rigid conditions are laid down governing the whole process Far too little control is at present being exercised over pasteurization by the medical and sanitary authorities If pasteurization is to be recommended as the chief measure for protecting the public from milk-borne disease, then no effort must be spared to ensure that the whole process is carried out efficiently and that subsequent contamination of the milk is avoided Ten pages of the report are devoted to discussing the more important arguments for and against pasteurization Though many pseudo-scientific objections have been advanced against it, the authors have been unable to find any that are supported by adequate evidence On the other hand, there is a considerable amount of evidence to show that when pasteurization has been introduced on a large scale milk-borne disease has been practically abolished There is a very interesting discussion, to which only a brief reference can be made, on the principles of milk grading The main conclusion is that the milk of *producers* should be graded and paid for on the basis of quality—fat content, cleanliness, and freedom of the herd from disease—but that milk for the *consumer* should not be graded Without an adequate financial stimulus the producer cannot be expected to take the extra trouble and incur the additional expense required for building up a healthy herd and for producing clean milk Quality payment, however, should not be passed on to the consumer He should be provided with one quality of milk only, or at the most with one quality of raw and one of pasteurized Multiple grades merely confuse the public and have very little effect on raising the general level of the milk supply

Finally the authors discuss something of the economics of milk distribution A few decades ago the distribution of milk was a primitive business, carried out by the farmer himself or by a simple intermediary With the rapid growth in many countries of an industrial population the need for milk in the towns has increased considerably, while at the same time the farms producing the milk have been pushed further and further away from the centre of consumption To meet this situation a milk-distributing trade has grown up The term "distributing trade" is really a misnomer The distributor is no longer a mere link between the producer and the consumer, he now constitutes an essential part of the structure of the dairy industry It is he who is responsible for the collection of the milk, its cooling, transportation, filtration, pasteurization, bottling, refrigeration, and final delivery to the actual house of the consumer In addition, he is often faced with the problem of dealing with surplus milk, and is therefore constrained to build factories to turn it into butter, cheese, condensed milk, dried milk, and so on All these articles have to be marketed at home or abroad, and a complex business organization has therefore to be built up Such an agency can pasteurize, bottle, and distribute milk of a high standard of cleanliness and safety at a cost only slightly in excess of that demanded by the smaller producer who sells his own milk unbottled and in a potentially dangerous condition The conclusions to be drawn from this may be stated in the words of the authors

"We believe that the future of the dairy industry lies in the gradual elimination of the small and often inefficient distributor, and its concentration into the hands of large, well-organized firms which are making use of *every aid that science can offer them to improve the* technical efficiency of their business and the high quality of their products Just as, during the past century, the water supply of our large towns has passed out of the hands of multiple small producer-retailers into the hands of large concerns, controlled by the municipality, a public utility company, or some similar body, so, in the future, we believe that milk for human consumption in the liquid state will come to be regarded more and more as an article of food over which such care has to be exercised that none but large and efficient organizations will be allowed to handle it"

This is a bold prophecy, and one which, provided adequate governmental restraint is exercised over the quality and selling price of the milk, the public health authorities of this country may well wish to see fulfilled

IMMUNIZATION AGAINST TYPHOID

The Croydon outbreak of typhoid fever has again raised a question which it is important finally to settle What measures can be taken to protect individuals perhaps already exposed to infection? Until recently the only available immunizing agent has been vaccine, and this has sometimes been withheld on the supposition, based on the conception of the "negative phase," that the administration of vaccine will for the time being lower resistance instead of increasing it, an effect which might be disastrous during the incubation period An examination of actual evidence lends no support to this purely theoretical objection on the contrary, there are good reasons for believing that vaccine is strongly indicated under these conditions Perhaps the most extensive and careful study bearing on this point is that of Ramsey,[1] who gave vaccine to 2,402 household contacts, of whom only nine subsequently developed typhoid fever, while among 2,886 unvaccinated contacts no fewer than 203 did so On a similar scale was

[1] *Amer J Hyg* 1935 21 665

the enteric infection was complicated by streptococcal conditions—namely, erysipelas and septicaemia In the erysipelas case serum cleared up the enteric symptoms, but the erysipelas relapsed and death took place suddenly from what appeared to be coronary thrombosis several days after the temperature had settled The septicaemic case ran a protracted course, and the patient died exhausted from multiple abscesses In another case the patient appeared to do well after serum treatment, but developed mental symptoms at a later date and died The three remaining fatal cases were not influenced by serum and the patients died in the typhoid state with the usual concomitant hypostatic pneumonia

The Effect of the Serum

The effect of the serum I have graded as excellent, good doubtful or negative By excellent I mean a rapid drop in temperature with amelioration in toxaemia the changes taking place within forty-eight hours of the last dose of serum This result was noted in twenty three out of the sixty-one cases treated In some of these the temperature was normal within two or three days of serum administration and remained normal thereafter, except for a temporary disturbance occasioned by the development of a serum rash The effect of the serum on toxaemia was always more marked than on pyrexia Toxaemic symptoms generally disappeared within a week of serum administration and in several of our cases were noted as absent within forty eight hours of the last dose In twenty-one cases the effect of the serum was classed as good By this is meant the inauguration of a brief lysis following serum administration this lysis being of shorter duration than occurs naturally in typhoid and being accompanied by a marked reduction in the toxic symptoms In the forty four cases comprising these two groups the incidence of complications was negligible Where the patient s symptoms seemed to be only slightly benefited or where the benefit was temporary the effect was classed as doubtful, seven cases falling into this category Where the illness pursued its course completely uninfluenced after serum inoculations the effect was classed as negative ten cases were of this type

Two batches of serum seemed to be less potent than others in the fifteen batches so far employed On reference to Dr Felix it was ascertained that the failure of therapeutic response with these batches was related to a lower antibody concentration Apart from this the only disappointing results we have had with the serum were obtained with mixed infections Several members of one family recently under treatment had a particularly virulent form of infection and although the response to serum treatment was slow in one of them all recovered Relapses have occurred twice in serum treated cases but repetition of the serum speedily aborted these Delayed serum sickness is not uncommon after administration of this serum Urticarial rashes with pyrexia lasting for a few days are the usual effects noted

Summary

To sum up in the majority of cases so far treated the Felix serum has been beneficial sometimes dramatically so In not less than one third of the serious cases the results were excellent in another third they were definitely good while in the remaining third they were doubtful or negative The beneficial effects are greater on the toxaemic manifestations of the enteric syndrome than on those attributable to local lesions in the intestine Complications were exceedingly rare in serum treated cases

The position of the Felix serum as a specific remedy in the management of typhoid fever is in my view now as firmly established as that of anti meningococcal serum in the treatment of cerebrospinal fever Whether its effect is due to its "anti Vi" or to its 'anti O' concentration, or to both I cannot say, as all the batches used in our wards contained both antibodies

Clinical Memoranda

Union of Carpal Scaphoid (by Immobilization) after Six Weeks' Delay in Treatment

The following case of successful treatment of carpal scaphoid fracture by immobilization seems to be worthy of record, as it might encourage others to persevere with non operative treatment, even in late cases

On February 9, 1937, the patient, a young woman of 23, sustained a severe injury of the right wrist from 'back-fire" while cranking a car This was diagnosed and treated (elsewhere) for six weeks as a "badly sprained wrist During all this time the patient suffered from persistent pain on the radial side of the wrist, and from

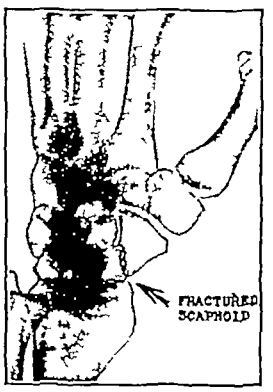

FIG 1

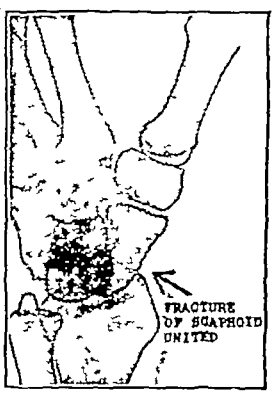

FIG 2

inability to pick up even light articles or to write at all (The thumb wouldn t work)

I first saw her on March 12 From the duration of the disability and the location of tenderness in Cloquet s snuff-box, a provisional diagnosis of fractured scaphoid was made, and the patient sent for x ray examination The x-ray report (March 13) states and the negatives show, a transverse fracture of the scaphoid (Fig 1) On March 14 the wrist was put up in a plaster of-Paris splint (dorsal slab etc) in extension and slight ulnar adduction from below the elbow to the heads of the metacarpals The palm was left free from the wrist-joint distally, except that the thumb was immobilized as far as the head of the metacarpal A stout copper wire was applied across the palm

From this moment pain completely disappeared, and the patient was able after ten days to use the thumb for all purposes The grip became very strong, and she carried out all her duties in stripping the coats, brushing shampooing and generally manhandling dogs of all breeds in the course of her job in a dog shop She also typed drove a car or played the piano all the time after ten days There was no discomfort throughout this period until May 14, when she complained of soreness over the lower end of the ulna Fearing a pressure sore

the successful effort reported recently in this journal by R Taylor[2] to combat typhoid fever in the Basque refugee children's camp in this country five cases of typhoid fever occurred under conditions in which infection might have been expected to spread readily, but after vaccination of the remaining 4,000 children no further cases occurred A fact of significance is that neither in these nor, as far as we are aware in any other studies is there to be found a record of cases in which vaccination was followed by an exceptionally severe attack of the disease, such as might well occur if the process can be positively harmful It is perhaps relevant to this question that the advocates of vaccine for whooping-cough are convinced of its capacity to prevent or at least to modify, the disease when given after exposure to infection here the longer incubation period is perhaps more favourable to such attempts These and other facts seem to point to the advisability of active immunization in circumstances such as have recently existed in Croydon It is highly desirable that official opinion on this question should be made clear, in order that appropriate action need not be delayed by doubts and questionings

A somewhat different problem is the scope of usefulness of anti typhoid serum Studies by Felix of the different antigens of the typhoid bacillus have led to the production of a therapeutic serum, now obtainable from the Lister Institute, which is of unquestionable efficacy in experimental infection in mice Clinical trials of this serum have been conducted in Dublin in Palestine, and in China it was also employed during the Bournemouth epidemic last year, the results being reported by H Cookson and R V Facey[3] in this journal A further report by C J McSweeney on the effects of its use in Dublin will be found on page 1118 From the statistical point of view the results obtained are necessarily inconclusive, chiefly because the treatment has been reserved for more severe cases, but the authors of published reports are all agreed on its usefulness It is reported in the daily press that this serum has been given to contacts of cases which occurred in Kensington This is a new departure and if a clinical experiment were feasible under conditions which would furnish conclusive evidence of its value the results would be of great interest For those who prefer not to rely entirely on a comparatively untried method of purely passive immunization a third alternative exists in the simultaneous administration of serum and vaccine a type of proceeding for which there is ample precedent in other connexions

POISONING BY ELIXIR SULFANILAMIDE

A recent outbreak of poisoning in the U S A has demonstrated in a sensational and tragic manner the unexpected dangers that may attend the introduction into therapeutic use of chemical compounds without an adequate preliminary trial of their possible toxic actions A full account of the matter is given in the *Journal of the American Medical Association* of November 6 An American firm found that sulphonamide was soluble in diethylene glycol a synthetic product somewhat resembling glycerol in its physical properties An elixir containing 10 per cent sulphonamide and 72 per cent. diethylene glycol was made up and administration was recommended in doses of two to three teaspoonfuls every four hours for one or two days On October 11 six deaths were reported from anuria following the use of this remedy The danger was promptly reported in the medical journals and the U S Food and Drug Administration worked energetically to stop further consumption of the elixir This involved tracing no fewer than 700 shipments The number of deaths however has since risen to 60 Investigations in the laboratories of the American Medical Association have shown that the lethal action of the elixir was due to the diethylene glycol rather than to the sulphonamide In dogs and rats a dose of about 13 c cm of diethylene glycol per kilogramme produced death from injury to the kidney and liver and similar effects were caused by the elixir in corresponding doses Before this accident comparatively little was known of the toxic actions produced by diethylene glycol $[(CH_2OH\,CH_2)_2O]$ but the toxicity of ethylene glycol $(CH_2OH)_2$ and of dioxan or diethylene dioxide  had been studied by many authors In a recent summary of this work Browning[1] states that the two last mentioned substances injure the kidney and the liver Experiments on small animals indicate that the relative toxicity in descending order is ethylene glycol diethylene glycol and dioxan The last substance caused however some serious industrial poisoning in 1933 It is therefore scarcely true to say that nothing was known previously about the toxicity of diethylene glycol since much attention had been paid to the possible toxic actions of various related compounds and enough had been discovered to warrant caution in therapeutic administration The full dose of elixir sulfanilamide recommended by the vendors (three teaspoonfuls every four hours) would provide about 50 c cm of diethylene glycol in a day This is much less than the lethal doses found for animals and the American investigators suggest that sulphonamide and diethylene glycol may produce additive toxic actions when given in combination Further research into these toxic actions is required but enough was already known to make such a tragedy that has occurred wholly inexcusable Sulphonamide is a powerful drug and potentially toxic Diethylene glycol belongs to a group of drugs of which certain members have given rise

[1] *Toxicity of Industrial Organic Solvents* Medical Research Council Industrial Health Research Board. 1937 Report No 80

the plaster-of-Paris splint was removed, and before deciding upon renewal the wrist was radiographed again Dr Ff Roberts reported that the fragments of the scaphoid had now united, and splinting was discontinued, after *eight and a half weeks in the same plaster cast*

On May 21 there was full movement of the right wrist-joint in extension, flexion, pronation, and supination The grip (practised throughout) was unimpaired, and there was no pain and no disability

Looking back, it is of interest to note that in July, 1921, a most interesting and exhaustive article of eighteen pages by Alan H Todd (London) on fractures of the carpal scaphoid appeared in the *British Journal of Surgery* (p 7) which advocated only three to four weeks of immobilization on a cock-up splint, admitted that in some cases the functional result was not good, and recommended in such cases operative removal of the scaphoid The article concluded 'From all that has been written about fractures of the scaphoid, and the many conflicting accounts that have been given of the results of various treatments, one fact emerges most clearly—namely, *that all methods of late treatment are uncertain and unsatisfactory*"

Cambridge R SALISBURY WOODS, M.D, F.R C S

Cerebral Malaria

A case of cerebral malaria, with recovery, may be of sufficient interest to be placed on record

The patient a well-built Irishman of 55 with a pale rather earthy complexion was admitted to the Albert Dock Hospital at 3 p m. on August 4 1937 While walking along the road he had a fainting attack and fell On admission he was semi-conscious, with very slow cerebration but answered to a shouted question His temperature was 99° F the pulse 86, and respirations 24 The pulse was strong the breathing loud, and the pupils small and equal At 6 p.m jerky twitchings of his hands and feet started and by 7 o clock they were almost continuous his pupils were then dilated but equal and reacting. His condition at this stage closely resembled an alcoholic coma—a mistaken diagnosis which Dr Manson Bahr informs us was made several times during the great war with fatal results All tendon reflexes were normal, with a flexor Babinski The temperature was now 102 6° the pulse 120 and respirations 24 At this point a blood film revealed a heavy infection with malignant tertian rings and crescents The patient showed extreme irritability and appeared unconscious, but could just be roused at times Quinine hydrochloride 3 grains in 10 c cm of distilled water was given intravenously at 9 15 p.m adrenaline 10 minims and one capsule of amyl nitrite by inhalation The quinine was repeated an hour later

The next morning the temperature was 97° pulse 84 and respirations 20 and the patient was able to give a history of having been at Takoradi West Africa from May 22 to 29 he had had vomiting with nausea and lassitude, on and off ever since— never any fever

A blood count showed red cells 2 010 000 per c mm haemoglobin 45 per cent. colour index 1 1, white cells 6,250 per c.mm polymorphs 70 per cent. lymphocytes 25 per cent and monocytes 5 per cent. The red cells showed anisocytosis and polychromatophilia some stippling. and heavy infection with malignant tertian rings and crescents He was given 1½ grains of atebrin three times daily On the third day there was a rise of temperature to 100 of the pulse to 96 and respirations to 28 with return of dizziness Since then the patient has made a good recovery on atebrin iron mixture and fluids a blood film on the fifth day showed malignant tertian crescents only

We are indebted to Dr Manson Bahr for permission to publish this case

Reviews

INDUSTRIAL HYGIENE AND MEDICINE

Recent Advances in Industrial Hygiene and Medicine By T M Ling, B M M R C P With foreword by J A. Nixon, C M G, M D., F R C P (Pp 212 29 illus. 12s 6d) London J and A. Churchill 1937

In this book Dr Ling has attempted to 'survey the more important advances in our knowledge of Industrial Hygiene and Industrial Medicine since the war" The best standard by which his success can be measured is a practical one Does the book contain, in a practically useful form, the information needed by medical officers engaged in industry by certifying factory surgeons, and by medical practitioners whose patients are industrial workers? The practical value of the book to industrial medical officers and to certifying factory surgeons is, we believe, definite Its value to medical practitioners is less obvious, though it may be none the less real

The book opens with a chapter on the medical supervision of workers in a factory In this chapter the physiological and psychological principles of occupational selection are reviewed Chapters follow describing some of the causes of industrial sickness and accident In view of the current neglect of the emotional, social psychological elements in the aetiology of sickness and accident Dr Ling is justified in devoting a relatively large amount of space to the psychological factors in health, sickness, and accident Over-emphasis of the psychological" is however, a very real danger "The neuroses of industry' are discussed in chapter 4 and industrial fatigue in chapter 5 Dr Ling then turns to consider recent advances in ventilation and lighting, these chapters are well done Dust and its effects and noise are rapidly surveyed in the following chapters The concluding chapters deal with lead poisoning, the toxic effects of gases, and industrial dermatoses All that Dr Ling has to say concerning the 'Advances in the more strictly medical and toxicological aspects of his subject is compressed into thirty-four pages out of a total of 200

Perhaps it would have been better if the author had used all of his space for writing a book upon "Recent Advances in Industrial Hygiene and Industrial Psychology for Works Medical Officers Industrial poisoning is too large and too important a subject to be discussed in a summary fashion Nevertheless, it must be recognized that Dr Ling has packed a surprising amount of valuable information into a narrow compass We can recommend this book to any medical man whose work takes him into factories, and to all medical men who wish to learn something about the psychological factors in industrial illness Nevertheless the style is uneven and makes an undue demand upon the reader's attention A few rather crude clichés occur with irritating frequency The meaning of the last paragraph on page 69 is not clear to us We read 'A study of shell shock revealed the fact that these conditions symbolized the reaction to adverse conditions of people, whose emotional make up and behaviour had been inappropriate from their early years In other words, the basic causes were *multiply* [*sic*] determined by early training and environment, while the war acted as a precipitating factor On page 68 sacrostant" should read sacrosanct

Dr Ling's task was rendered difficult by the absence of recognized textbooks' of his subject When the difficulties which faced him are realized the measure of his success in meeting them becomes apparent.

to dangerous toxic effects Yet hundreds of shipments of a mixture of the two were sent all over the U S A without any preliminary attempt to determine its safety As the leading article in the *Journal of the American Medical Association* states "Surely there has been no blacker picture of the inadequacy of our present food and drug laws or the lack of common scientific decency in drug manufacture than that illustrated by this tragic disaster"

THE DOCTOR'S HEART

Articles on the diseases of their profession have a certain fascination for medical readers, particularly if they are well documented with statistical tables Attention may therefore be drawn to a brief but valuable paper by A Morris Ginsberg of Kansas City in the October issue of the *Journal of the Missouri State Medical Association*, entitled "The Doctor's Heart." Heart disease is described as the leading cause of death among physicians practising in the United States of America Its incidence (40 per cent of all deaths) is almost double that found in the general population (23 85 per cent) Cerebral haemorrhage pneumonia, and arteriosclerosis take second place Among members of the Jackson County Medical Society (1932–6) heart disease was the cause of 36 2 per cent of all deaths Of twenty-one heart deaths eight were due to coronary occlusion six to coronary sclerosis, five to chronic myocarditis, and two to rheumatic heart disease Of further interest is a questionary submitted to members of this society Out of 594 practitioners—average age 49 94 years—232 sought medical advice in the last two years, and of these eighty-three have some heart disturbance, which in 74 69 per cent. was degenerative in type Finally a survey of 279 premedical students at the University of Kansas for 1935 and 1936 shows that six are affected with rheumatic heart disease an incidence of 2 1 per cent., which is comparable to the estimated percentage in the general population

CEREBROSPINAL RHINORRHOEA

The discharge of cerebrospinal fluid from the nose, sometimes in large quantities, is a peculiar phenomenon fraught with an ever-possible danger—of which generally speaking, the patient is mercifully oblivious—in the form of intracranial infection The escape of fluid may follow fractures of the base of the skull, complicate operations on the nasal sinuses or be of the apparently spontaneous variety, to which contributory factors may be a congenital deficiency in the cribriform plate of the ethmoid or a slowly growing cranial or intracranial tumour At a recent discussion on injuries of the frontal and ethmoidal sinuses with special reference to cerebrospinal rhinorrhoea and aeroceles at the Royal Society of Medicine [1] opened by Professor Hugh Cairns Sir StClair Thomson who thirty years ago differentiated between traumatic and "spontaneous" cases of cerebrospinal rhinorrhoea pointed out that the purely spontaneous variety must be distinguished from that associated with conditions like meningocele, which was not strictly spontaneous He did not think that the spontaneous form could be traced to any congenital defect, because it occurred mostly in adults it generally developed without any history of accident or of predisposing disease, and x-ray examination was of no assistance In the absence of gross defects the leakage probably took place along the sheaths of the olfactory nerves The occasional association with aeroceles in traumatic cases is an interesting one The air enters the cranial cavity through a fracture, often in the orbital plate, and usually is forced in by the patient blowing his nose, an act from which he should be restrained but which he is likely to perform because of the discomfort arising from the collection of blood clot in the nose In fractures of the frontal sinus and cribriform plate there is a risk of intracranial infection not only immediately after the accident but also at a later period, when a catarrhal infection of the nasal passages may break through barriers weakened by the injury The infection usually produces purulent leptomeningitis but sometimes a cerebral abscess or purulent ependymitis may result This risk of infection may be reduced by operative closure of the rent in the dura mater, which is usually found in the region of the cribriform plate It is best dealt with either by suturing or by the application of a muscle or fascial graft The operation is indicated in cases of delayed and persistent cerebrospinal rhinorrhoea following head injury

[1] *J Laryng*, 1937 52 589

THE NATURE OF VIRUSES

There must still be many who are yet unaware that doubt is now being cast on the living nature of at least some of the filterable viruses These numerous agents of disease differ from bacteria in many ways, but chiefly in their size, which in some cases is so small that it approaches that of some of the most complex single molecules, and in the fact that they are incapable of multiplication except in a living host. Speculative doubt of their living nature has been expressed more than once before, and scraps of actual evidence connected with their properties have seemed to support it, but a more formidable campaign aiming at proof that certain viruses at least are non-living dates from Stanley's assertion of two years ago that the virus of tobacco mosaic disease can be crystallized Subsequent investigation has made this observation appear in itself less dramatic and conclusive, but tends to confirm the conclusion based on it that the virus of this disease cannot be a living micro-organism The active agent appears to be a characteristic protein found only in infected plants and produced in them in great abundance At a meeting of the Section of Comparative Medicine of the Royal Society of Medicine on November 24 these discoveries were described by J Henderson Smith and F C Bawden from the point of view of the plant microbiologist, and by J D Bernal from the point of view of the physicist, whose task it has been to study the structure of the particles in virus suspensions by methods such as that of *x*-ray spectro-

AUGUSTE FOREL AND HIS WORK

Out of My Life and Work By Auguste Forel, translated by Bernard Miall (Pp 352, 8 plates 16s) London G Allen and Unwin 1937

Auguste Forel, whose autobiography has just been translated into English, is perhaps best known by his study of the habits of ants, which culminated in that remarkable book *Le Monde Social des Fourmis* Yet this was only one aspect of his many-sided activities, and plays a minor part in this autobiography Here without any straining after artistic effect indeed with a frankness that is sometimes naïve, he draws his own portrait line by line, till one realizes just how he became the man he did Born in 1848, that year of revolutions, he seems to have been inoculated with the revolutionary spirit at birth Brought up in a small town in the Canton Vaud by a mother to whom he was devoted he nevertheless reacted vigorously against her extreme Calvinism refused to be *confirmed, and remained throughout life a militant* agnostic Yet in other respects the repressive atmosphere of his childhood left marks which endured for some years Even his consuming interest in ants was checked as evidence of a cruel spirit Becoming for a time shy and diffident, he was the predestined victim of bullies at school, and as a youth his prudishness prevented him from entering social life, therein differing from his beloved ants!

At last he was allowed to study natural science, and decided on a medical career Here he found release and his personality rapidly expanded From a series of valuable observations on the structure and functions of the brain he was led to take up psychiatry in which he made a name so soon that at the early age of 31 he was appointed to take charge of the Burghölzli Asylum Hitzig, an able neurologist of the laboratory type, had resigned finding himself quite incapable of dealing with the disgraceful conditions obtaining there Forel, in the *face of political and social opposition, resolutely cleared* out that Augean stable, and by his policy of thorough ' reduced chaos to order He tells an amusing story of the tricks to which the morphine addict will resort One day a fine pie was sent him, by whom he knew not On cutting the crust it was found to contain hypodermic syringes and a large quantity of morphine Inquiry revealed that a lady had inserted these in a pastrycook s shop but by some oversight the pie was addressed to Forel instead of to a morphinist patient in the asylum

As his outlook widened he became convinced that alcoholism, social problems psychiatry, penal law and science are inseparably connected and he became an impassioned social reformer in many directions But he never seemed to think that alcoholism was a symptom—for him it was a prime cause and he became an apostle of total abstinence, in season and sometimes very much out of season Was it his Calvinist upbringing that made him increasingly doctrinaire in later life? The complete failure of the gigantic experiment of Prohibition in the United States influenced him not a whit On he went, sometimes a visionary tilting at windmills sometimes a practical reformer achieving useful results No fear of change, no perception of the strength of instinctive prejudices deterred him In turn feminist pacifist, internationalist Bolshevist, but always abolitionist he welcomed Henry Ford s peace ship and was a League of Nations man before President Wilson For him there were no shades of grey everything was clearly black or white Robert Bridges in his *Testament of Beauty* was appalled at the utter slavery of bees and ants and thought that this was travestied by man s sentimental approach to the subject Forel on the other hand, would have had us go to the ant for social enlightenment Yet when he cut into a nest of the Colombian fungus growing ants he found them far from peaceful "In a moment I was bitten by the sharp mandibles of the workers until the blood was running down my hands and face They pursued me furiously for many yards, biting my clothes and my skin

His chief steadying influence was his sympathetic and understanding wife But like many pacifists he remained a single minded fighter to the last for the truth as he saw it tongue and pen being mightier for him than the sword—to the very last, for he even wrote his own funeral oration, lest he should be buried with Christian rites His best memorial will be his work for psychiatry in Switzerland, though his most popular monument is founded on an ant-heap

FOUNDATIONS OF PHYSICAL CULTURE

The Scientific Basis of Physical Education By F W W Griffin M A M D With a Foreword by Sir E Kaye Le Fleming M A. M D (Pp 200 7s 6d net) London Humphrey Milford Oxford University Press 1937

At the present time, when the 'powers that be are awakening albeit belatedly, to the realization of the value of physical culture in individual and national life a tremendous impetus has been given to the study of physical education and opportunities made for its development In this nation wide campaign it is hoped that eventually all school children and young adults will have the recreational facilities they need for improvement of health and physique

While much attention is necessarily being focused on actual schemes of training to be used, the physiological principles underlying them must be constantly borne in mind so that the best possible use may be made of the periods of training The opportune publication of *The Scientific Basis of Physical Education* by Dr F W W Griffin will provide a stimulating and provocative book for medical practitioners who wish to have some understanding of the general principles of physical training and the physiological and psychological problems connected with it, the complexity of which is scarcely appreciated by the average medical man Sir Kaye Le Fleming points out in the foreword that it is essential for the success of the present schemes that they should be closely associated with the science of medicine and that there should be firm co-operation between the physical educationist and the medical practitioner If the latter is to make any valuable contribution to the work he must be specially informed and observant of the various aspects of physical education

Dr Griffin s book will be most helpful in this respect for it is a serious attempt to summarize the present state of medical and scientific knowledge in regard to the bodily effects of muscular activity The author discusses briefly and simply the chemical, mechanical and nervous factors involved in bodily exertion and the changes that take place in the respiratory and circulatory systems in response to increased effort He suggests the need hitherto often entirely disregarded of considering psychological reactions in physical education His chapters on posture are unusually interesting, and he gives the foot the important place it deserves in determining the cause of postural faults Having enumerated bad foot habits, it is a pity that he has not similarly enumerated some good habits which would help in maintaining or acquiring a foot of such desirable shape and functioning as he describes The

graphy Almost all work on animal viruses proceeds on the assumption that they are living micro organisms a view which those responsible for this work are exceedingly reluctant to question and the arguments in its favour were expressed at this meeting by C H Andrewes who described the few attempts which have hitherto been made to identify the active agent in animal viruses with a protein and submitted that they are of little significance In his view the powers of adaptation exhibited by viruses their capacity for multiplication in unaffected insect vectors as well as in the infected animal and the resistance evoked by infection are facts consistent only with the belief that viruses are living things It would be idle to speculate on the future course of this controversy, or to suggest that it may lead to the revelation of some hitherto unsuspected form of life perhaps best to be described by the old term *contagium vivum fluidum* but it may be pointed out that viruses vary considerably in particle size and some of the larger ones can be photographed and have all the appearances of miniature bacteria Short of assuming that viruses are of two different kinds living and non-living—a proposition which their generally similar behaviour does not support—the two points of view here expressed are quite irreconcilable The advent of the ultra-centrifuge which will precipitate not only very small particles in the ordinary sense but even some of the larger molecules and the impact of other physical and physicochemical methods on the biological sciences are likely to have further interesting and perhaps startling results

TENDON SUTURE

Kanavel whose work based upon anatomical researches has done so much to improve the surgery of the hand, has remarked that he would rather have the average surgeon operate upon him for appendicitis than for a severed flexor tendon [1] an opinion with which many will concur There can be no doubt that there is a great deal of disability due to the bad results following tendon suture performed by those inexperienced in this branch of surgery, and it is a matter for comment that much of this surgery is carried out in casualty departments by relatively junior members of hospital staffs In the course of a discussion on infections of the hand at the Annual Meeting of the British Medical Association at Bournemouth in 1934 it was pointed out that patients with infection of the hand do much better if admitted to hospital and kept in bed than if treated as out patients in the casualty department. The same may be said to apply to many cases of injury and especially to those in which tendons or nerves have been divided and require repair In a recent paper on severed tendons and nerves M C O Shea of New York advocates primary repair of severed tendons as soon after the injury as possible fine black silk being used in the form of simple mattress sutures with additional interrupted peripheral stitches When both digital flexor tendons are divided in the finger he believes that only one, the deep flexor should be repaired, and that one slip of the splitting insertion of the superficial flexor tendon should be used to form a new annular (vaginal) ligament by passing it over the profundus tendon and sewing it to the lateral expansion of the digital extensor tendon If both divided tendons are repaired at the same time there is a tendency for them to adhere to their surrounds in a mass of scar tissue Repaired wounds should not be drained because if drainage is necessary primary tendon repair is not advisable The post-operative treatment of these injuries is so important that it is in this period particularly that the patient should be in hospital whenever possible The gradual replacement of splints applied to relieve tension on the suture lines by others in which there is a gradual "taking up" of the tendon and the institution and control of movements can only be carried out to the best advantage with the patient in hospital under constant supervision At first sight such treatment may appear to be economically impossible but the loss to the individual and the community by impaired function of the hand must be weighed against this. Much disability is caused by the bad results of treatment of injuries of the hand There is no doubt that this could be diminished if patients with severed tendons were admitted to hospital wards and treated by the more experienced members of the surgical staff

SURGEONS AT LEISURE

In the past few years the general public has become accustomed to the publication of novels and the production of plays by doctors The interest of the public in these literary works has been aroused mainly because they portray some phase or another of a doctor's life or his place in the social and even economic structure The exhibition of pictures and sculpture by Fellows and Members of the Royal College of Surgeons of England which has just closed is of interest because except for two exhibits it is impossible to diagnose from the works on show the occupation of the artists The pictures incline more to the academic than the surrealist technique while the sculptures by their anatomical accuracy and finish are either classical Greek in inspiration or show the influence of Rodin by the skilful grouping of the figures and their "liveness The exhibition is therefore the work of doctors and not an artistic rendering of doctors' work The outstanding pictures were two oils by the late Professor Tonks One painted during the war shows an underground casualty clearing station near Arras the other commemorates an incident during the Archangel adventure in 1919 The former by its dull tones and lighting captures the atmosphere of peace and quiet after the attack is over It is not surgical" in detail though a surgical subject It is a picture and not a mere record of the work of doctors In the second picture the grouping and movement of the figures the almost theatrical composition and colouring, and the atmosphere of relief and joy make it one of his great pictures Tonks was chronologically a surgeon

final chapter on the classification of physical types is entertaining and makes one appreciate the difficulty of differentiating clear-cut types in a mixed race such as ours which is constantly absorbing and modifying alien strains

The book closes with an epilogue in which we are reminded that the demand for "bread and circuses," which foreshadowed the fall of the Roman Empire, seems to be becoming our national cry to-day But perhaps the time may come when the relinquishing of the imperialistic outlook will be regarded not as disastrous, but as a progressive step The book ends on a hopeful note that the light of knowledge, of science, and of understanding will make it possible for all members of the community to develop their latent physical and mental capabilities and be able to enjoy and adapt themselves to fuller life in a progressive world A useful bibliography is appended

THE CHILD WITH SPASTIC PARALYSIS

Children Handicapped by Cerebral Palsy Psychological Factors in Management By Elizabeth Evans Lord With a Medical Explanation by Bronson Crothers M D (Pp 105 5s 6d net.) New York The Commonwealth Fund London H Milford, Oxford University Press 1937

This is an admirable guide for all those concerned with the physical and mental training of cases of spastic paralysis in children A simple medical explanation of the various conditions involved is given by Dr Bronson Crothers The physical training is then dealt with, and it is pointed out that all exercises must be of interest and use to the child, relaxation exercises, especially of the eurhythmic type, proving the best Prediction of the ultimate physical capacity of the child is very important, and it is pointed out that unless he can balance himself by the time he is 6 the outlook is bad

Difficulties in mental testing and grading are described These children have difficulties in spatial discrimination but manage numbers better than might be expected Apart from grading, tests are useful in elucidating the nature of the defect Teachers of such children must remember their great susceptibility to fatigue and also that their capacity for learning may vary from day to day, though some have fair emotional control and quite good persistence The greatest difficulty arises with those who have no very obvious physical defect, but a marked feeling of inadequacy, especially when they may have got on fairly well at school but fail hopelessly in the competition of the labour market Those with serious physical disability usually accept this with reasonable equanimity, though they may be very self-conscious before strangers The mother's emotional reactions and her refusal to face the handicap often add greatly to the difficulties both of the child and of the teacher

BUSINESS ASPECTS OF PRACTICE

The Business Side of Medical Practice By Theodore Wiprud. (Pp 177, illustrated 12s net.) Philadelphia and London W B Saunders Company 1937

Mr Theodore Wiprud is just as emphatic on the lack of business capacity in the vast bulk of the American medical profession as anyone has ever been over our similar shortcomings in this country He does not probe far into aetiology—the vexed question of the seed and the soil whether, that is, it is the training and education of the medical student that are at fault, or whether the type of mind that is attracted towards medical practice is inherently repelled by business principles and incapable of assimilating them In general terms, Mr Wiprud's advice is just as useful for medical practitioners on this side of the Atlantic as on the other, but naturally, there are sections here and there which are scarcely applicable to British conditions The style, too, is simple and attractive, the author has more respect for "our maternal englysshe tonge" than some of his compatriots, though he avoids the word 'if" very pointedly, and replaces it by "in event" as a synonym He informs us that 97 per cent of American citizens die leaving no will, as the intestacy laws vary from State to State (some of them are on the English model, others quite different) his advice as to the making of wills is not unnecessary It is, very possibly, this problem of differing codes of law on the two sides of every inter-State boundary that accounts for the non existence in America of any organization corresponding to our medical defence societies—or is it that the American patient is less ungrateful and less litigious? It appears that medical witnesses enjoy privilege in American courts of law, though whether this is universal in all the States is not stated The interesting development which has not, so far as is known, reached these shores is the system of the "telephone secretarial bureau,' which has taken root in six of the larger American cities Its "major function is to transmit telephone calls from patient to physician A special listing is inserted in the telephone directory under the doctor's name, reading *If no answer call* (the bureau's number) In event the physician subscriber does not answer his telephone the patient calls the bureau, which locates him Not only are calls relayed but appointments are made according to the physician's instructions"

The typography and format of *The Business Side of Medical Practice* are worthy of the well known firm by whom it is issued

Notes on Books

John Melly of Ethiopia edited by KATHLEEN NELSON and ALAN SULLIVAN (Faber and Faber, 8s 6d) is a biography of the leader and organizer of the British Red Cross Ambulance units in Abyssinia In 1917 Melly left Marlborough to receive a commission in the gunners with whom he served on the Western Front during the last year of the war Shortly before the Armistice he was awarded a well-earned Military Cross Already in France a latent missionary spirit began to show itself in Bible readings with his men, and later at Oxford he was one of the founders of the Oxford University Bible Union From the university Melly went to St Bartholomew's, where he became a house surgeon During these and later years he presented an unusual combination of the social butterfly and the practical man of religion Eventually the unchanging ambition to become a medical missionary materialized, and Melly determined to establish a hospital and medical school in Abyssinia While reconnoitring the country with this object in view the imminence of the conflict with Italy necessarily modified his medical aspirations, for Abyssinia possessed no Red Cross organization When hostilities actually broke out Melly's knowledge of the country, its people and leaders, his surgical experience, and his enthusiasm for the task in hand marked him as the ideal leader of the British units which he was so largely instrumental in raising After surviving the rigours and dangers of the northern campaign Melly met a tragic end, during the days of anarchy at Addis Ababa, at the hands of one of the people he had done so much to help Apart from some excellent illustrations, this book is scarcely worthy of its theme It is composed almost entirely of extracts from letters and communiqués, the former too often loaded with trivial and irrelevant matter There is no feeling of chronology and continuity

before he was an artist, in the same way as Keats was a dresser at Guy's before he became known as a poet. An attempt to classify the exhibits and to find in them signs of the specialties indulged in by the artists failed The technique of the ophthalmologist is no more meticulous in detail than that of the pathologist Anatomical training does not prevent anatomical errors in figure drawing More striking than these failures to correlate occupation and technique is the ease with which one can pick out the ardent angler, the mountaineer, and the favourite holiday resorts of the exhibitor Landscapes show every country from Iceland to Morocco but with a predominance in favour of the English countryside Every phase of English weather is represented From another point of view the exhibition is of interest. The artists are realists There are no allegorical subjects, no striving after subtle portraiture, nothing Brangwynesque, and only a suggestion here and there of the influence of the modern poster technique It is a "quiet" exhibition, a "leisure" exhibition, and for these reasons, if one may be technical, it is essentially a release phenomenon, a release from the cares and worries of patient, hospital, and teaching

SKIN TROUBLES IN PREGNANCY

Dr Henri Vignes, in collaboration with other French writers, is producing a series of monographs on the diseases to which pregnant women are liable The first volume was concerned with the alimentary canal, and the second with the liver, pancreas, nutritional disorders, and abdominal wall The one now before us deals with diseases of the skin [1] Dr Vignes maintains that there is a fundamental distinction to be drawn between the general physiology of the pregnant woman and the metabolic life of those who are free from this complication which depends very little upon the mechanical influence of the enlarging uterus but much more upon the continual tax which the foetus levies on the mother in the course of its development—a tax which acts as a very powerful stimulus to all her organs and glands—and also upon the functions of the placenta, which is to be regarded as a temporary source of endocrines There are two obvious departments in this field of work (1) the discussion of such maladies as are peculiar to pregnancy, and (2) the influence of pregnancy on the course and therapeutics of such pathological conditions which, though not peculiar to pregnancy, may arise during that period In the domain of diseases peculiar to pregnancy dermatology plays a very small part. In a series of 22 000 accouchements collected by Perondi only 63 cases of non-venereal skin disease were mentioned These however, were all affections of considerable severity Among the dermatoses observed in pregnancy some run their habitual course, a few become less severe but a greater number are aggravated by the condition Dr Vignes, with the help of Drs Hanoun and Vial has written an interesting account of the cutaneous complications of pregnancy It appears that during gestation the physiological activities of the skin, like those of other organs are stimulated The proliferation of the cutaneous cells is more active and both the hair and the nails grow more quickly The sweat glands are more active All these factors naturally modify the course of such commonplace skin diseases as eczema, psoriasis, etc, which may supervene during the period One interesting point is that the scalp if affected by seborrhoea improves and the hair stops falling, the nails also grow more quickly We also note that Dr Vignes does not believe that there is such a thing as an auto intoxication of pregnancy, though he speaks of a "trouble humoral"—in other words of a disturbance of the body fluids—and he regards this disturbance as the real cause of the dermatoses of pregnancy

BLOOD-ALCOHOL DETERMINATIONS

A recent monograph by Dr H Elbel[1] gives a short but clear account of the methods used in blood alcohol determination and of the evidence regarding the relation between blood-alcohol content, alcohol consumption and intoxication These problems are of great medico-legal importance, because in Sweden, Germany and other Continental countries blood-alcohol determinations are used as a routine in cases where motor drivers are accused of intoxication The discussion of the possible errors shows the need for scrupulous care in the carrying out of this delicate micromethod For example, the use of an alcoholic solution for disinfection of the skin when taking blood may produce a huge error An account is given of the evidence for the relation between blood alcohol and total body content of alcohol and of the evidence for the rate of oxidation of alcohol in the body These subjects have been studied extensively, and there seems to be fairly conclusive evidence that if the blood alcohol content and the time of taking the alcohol are both known then it is possible to calculate with considerable accuracy the amount of liquor that has been taken The correlation between alcohol content and intoxication is a more difficult problem, since this relation is subject to the unavoidable error due to the well-known individual variation in respect of susceptibility to alcohol The extensive data that are accumulating from medico-legal examinations are tending however to show that the amount of alcohol needed to impair driving powers in the majority of persons is somewhat lower than was formerly supposed Widmark concluded that 1 6 parts per 1 000 of alcohol in blood was the average limit above which intoxication might be assumed, but the evidence now available suggests that a driver with 1 part per 1,000 in the blood is less safe on the road than a normal person

[1] *Die Wissenschaftlichen Grundlagen der Beurteilung von Blutalkoholbefunden* By Dr Herbert Elbel Leipzig Georg Thieme (RM 7 80)

The Earl of Athlone, Chancellor of the University of London, will open the Bernhard Baron Laboratories of the Royal College of Surgeons of England in Lincoln's Inn Fields on Wednesday December 8 at 2 45 p.m

The Avitaminoses by Professor W H EDDY and Dr G DALLDORF (Baillière Tindall and Cox, 20s.), is a work of exceptional interest, since it is concerned primarily with the human disorders and diseases caused by partial or complete vitamin lack. The authors give a full description of the well known consequences of gross vitamin deficiency, such as beri beri, scurvy, and rickets. They also discuss carefully the more difficult problem of the effects that may be produced by a suboptimal vitamin intake. Problems of this type are the action of vitamin A in checking infections of the respiratory tract, the influence of the anti neuritic vitamin on the function of the stomach and the gut, and the relation between vitamin C lack and haemorrhagic diseases. As we have indicated, the authors centre their attention on the problems of chief importance in ordinary clinical practice. Unfortunately it is much more difficult to determine the effect of a partial than of a complete deficiency of a vitamin, and the evidence as regards these important problems is contradictory and confused. The authors cite McCarrison's experiments as models of the type of information that is required. He fed rat colonies for years on diets modelled on those eaten by the poorer sections of the population in India and in England. Such diets produced a remarkable variety of lesions such as pulmonary infections, gastric ulcers, and renal calculi.

The publication of the papers read before the Second International Congress of Medical Advisers for Athletics held in Berlin in 1936 (Leipzig: Georg Thieme. RM.27 G.RM. 27.50) is, in effect a thorough survey of all the medical aspects of athletics. More than eighty papers were read at the six sessions of the Congress, the majority in German, others in French, Spanish, and Italian and four in English. The four English papers were contributed by two Japanese, a Hungarian, and an American. Most of the papers show evidence of painstaking thoroughness and attention to detail, and the remarkable improvement in the standard of athletics among Continental nations during recent years may be attributed to a large extent to the close liaison between athletics and medicine. Of great interest is the paper by Dr. Miyama (Japan) on the influence of sports upon the circulatory system. Studying the effect of certain substances upon the recovery of the circulatory system from fatigue after bodily exercise, Dr. Miyama noted the beneficial results of administration of glucose and vitamin B, and of oxygen inhalation.

The fifth edition of Professor A. J. CLARK'S *Applied Pharmacology* was favourably noticed in these columns at the close of 1933. A new edition has now appeared (J. and A. Churchill, 18s.). The author explains in his preface that the most important change has been the gathering together in the first quarter of the volume of all those substances which the body either manufactures itself or normally receives in its food. This rearrangement has called for the rewriting of most of the material concerned. Extensive changes in the remainder of the book have been made to bring it into line with recent advances in therapeutics. By constantly keeping this work up to date Professor Clark puts into focus for the practising doctor the results of research in pharmacology and the allied sciences.

Dr. KEITH MACARTHUR BROWN has done a good action by writing *Medical Practice in Old Parramatta* (Sydney: Angus and Robertson, 12s. 6d.). The story after all is not so very old for it dates from 1790 when the mortality was twenty five adults and two children out of a population of about six hundred. The doctors were few and combined the treatment of the sick with the acquisition of land and the care of stock. Much of their practice was gratuitous but out of the land they occasionally made fortunes. Some of the descendants of these early New South Wales doctors are still living and by their kindness Dr. Brown is able to illustrate his book with photographs of the pioneers. He traces their history, tells of their virtues and of their quarrels, gives pictures of the houses in which they lived and of the succession of hospital buildings in which they worked. Chloroform came early to the little town and by good fortune Hogarth Pringle soon introduced Listerian methods into its surgery. He had been educated at Edinburgh, had worked under Syme and had thus become intimate with Lister. The book is full of interesting detail and is well worth reading. Dr. Brown should be encouraged to write his personal reminiscences, for there is still much to be told about the town itself and why Parramatta allowed itself to be beaten by Sydney. It may be noted for correction in a future edition that the official record of the Royal College of Surgeons of England states that William Sherwin was admitted a Member on July 7, 1826, and received the Diploma of Fellow on May 5, 1862. It would be well therefore to look at his certificates if they are still available.

Practical Physiological Chemistry for Medical Students by G. M. WISHART, D. P. CUTHBERTSON, and J. W. CHAMBERS is published by John Smith and Son (Glas.) Ltd., at 3s. 6d. It is a convenience to both students and teachers alike to have a book covering the ground of their own practical course. This small volume is specially designed for the students of the Glasgow Medical School. It follows conventional lines, is well arranged, and is better than most other works having similar aims in that it is simpler, and does not attempt to impose too heavy a burden on the beginner. On each full page one side is left free for the student's own notes. Fault might be found with some of the directions given in the practical exercises. For example with no more guidance than appears in the book most students would fail with the osazone test for urinary sugars unless these were present in considerable quantity. Further the results of yeast fermentation can be achieved in about one twentieth of the time allotted to this form of test. The simple means of detection of urobilinogen in fresh urine might also have been included. Despite these minor criticisms the authors and publishers are to be congratulated on the production of an excellent book.

In his monograph *Les Fièvres Typho-exanthematiques en Égypte* (Alexandria, A. Procaccia. P.T.16) Dr. P. MODINOS, senior physician to the European Hospital at Alexandria, deals with the three types of typhus met with in Egypt—namely, historical, old-time, or epidemic typhus, murine typhus or Brill's disease, and Mediterranean exanthematic fever, otherwise known as boutonneuse fever. Illustrative cases of each type are recorded with an account of the author's experimental work on guinea pigs confirming the clinical diagnosis. A bibliography of 109 references is appended, in which though some British authorities are quoted we miss any mention of the valuable work of Dr. William Fletcher on tropical typhus.

The second edition of the *Introduction to Pathological Physiology* by Professor MAX BÜRGER, director of the Bonn University Policlinic (Berlin: Julius Springer. RM. 24, paper 25.80 bound) of which the first edition appeared in 1924 and was noticed in these columns has been practically rewritten by incorporation of recent work on vitamins and hormones, nutrition, infection, immunity, and allergy.

Dr. R. GORDON COOKE has written a *Textbook of Chronic Diseases: A Handbook for Nurses* (Faber and Faber. 6s.) which contains much useful and helpful information. The book is supplementary to the lectures and the experience the nurse gains in her training school when as a rule few chronic diseases in their terminal manifestations are seen. Dr. Cooke describes the advanced cancer case, chronic arthritis, and so on, and shows how much can be done to render suffering more bearable by wise and sympathetic nursing.

Reports of Societies

MEDICAL RESEARCH IN THE POST OFFICE

At a meeting of the Section of Epidemiology and State Medicine of the Royal Society of Medicine on November 26 Dr H H BASHFORD chief medical officer to the Post Office, gave a brief account of the medical service of this the largest industry, numerically speaking, in the British Isles and referred particularly to its opportunities for long distance medical researches as a result of record-keeping

Dr Bashford said that the Post Office employed 260 000 persons, of whom the postmen, the largest group, accounted for 80,000 The Post Office had a lifelong pensionable service on sickness full pay or half pay was allowed, and pay at pension rates for as long as there was a reasonable prospect of recovery Candidates on entering the service underwent a thorough medical examination One of the conditions of employment was that every established Post Office servant earning under £5 a week received free medical attendance of a good general practitioner range The practitioners undertaking this service were paid on a capitation basis In large towns like Liverpool and Sheffield there might be four or five doctors, each with 600 or 700 Post Office employees on his list, in smaller towns there might be one only About 2 600 practitioners all over the country were engaged in this service It implied an extent and intimacy of medical observation such as did not exist in many other industries He thought the Post Office must be alone among industries in possessing such an amount of material in the shape of accurate sick records of hundreds of thousands of people from the age of 16 (or in some cases 14) to 60 Such records analysed according to occupational and geographical groups lent themselves to certain useful lines of research

Follow-up Studies

An analysis had been made of 3,755 cases of pulmonary tuberculosis observed during the last twenty years Notwithstanding the long period of sick pay up to a year or more it was found quite constantly that only 50 per cent of all new cases were able to return to work at all and of those who did return in a supposedly cured or arrested condition 48 per cent left the service during the following ten years owing to recurrence or to the onset of other diseases Those who remained over the ten years however showed a more favourable picture the wastage during the following five years being not more than 14 per cent A study of the after-histories of 430 cases of gastric and duodenal ulceration showed that 31 per cent, however they might have been treated, regularly incurred a month's absence or more every year and a further 27 per cent incurred sick absence every year for from two to four weeks

Dr Bashford said that thirty years ago when he first joined the medical staff of the Post Office any boy presenting the condition of albuminuria was not accepted for pensionable service and was usually uninsurable or insurable only at a heavily loaded premium Owing to the relatively large number of these boys regularly presenting themselves for employment one of his predecessors took the risk and accepted some of them He was able many years later to ascertain what had happened to this group of persons numbering thirty With the exception of three who had left the service for extraneous reasons two who could not be traced and one who had died from acute nephritis (having also developed syphilis) seventeen years later the remaining twenty-four were all in good health and eighteen of them had sick records below the average. The youngest was then 43 and the oldest 54 From this and other observations it had been possible to demonstrate that this condition *per se* was of no importance whatever

Another study related to comparative records of physique It had been found that the present generation of London boys averaged 16 lb more in weight and 1½ in more in height than their predecessors twenty five years ago The gain in weight among girls was 9 lb and in height 1 in A group of 200 young people whose blood pressures according to prevailing opinions were abnormally high, but who were all apparently in good health, had been under observation, and their records in course of time might prove useful Another observation group of about eighty persons consisted of those who had undergone the operation of thyroidectomy, and it was hoped in course of time to throw some light on the long distance value of that procedure in enabling persons to stand up to the strain and stress of everyday life

Anti-catarrhal Vaccine

A comparatively large scale experiment with anti-catarrhal vaccine had also been carried out This was done with the object of preventing or reducing the considerable amount of sick absence due to colds or other catarrhal conditions The experiment, which had related to some hundreds of persons, had extended over three years and while he did not wish to claim any exaggerated scientific value for these observations, they appeared to indicate that the routine provision of anti catarrhal vaccine for the staff as a whole was not yet justifiable About twelve years ago two well known psychologists of what was then known as the Industrial Fatigue Research Board (now the Industrial Health Research Board) carried out a series of observations with a view to predicting the liability to the later development of inefficiency at work as a result of nervous disorder or some psychological disturbance in earlier years Ten years afterwards the group was reviewed Of seventeen boys who had originally been placed in the serious symptom psychological group, sixteen were still in the service none of them had incurred an abnormal sick record and in every case the character and efficiency report was excellent Of sixteen boys who had been classed in the slight symptom psychological group, one had since resigned three had been transferred two were not traceable and of the remaining ten one had a definitely poor character and efficiency report, and nine had excellent reports Of the twenty-two boys in the no symptom" psychological group, fourteen were still in the service of whom nine had excellent reports three slightly qualified and two definitely qualified

He next referred to the experience of the Post Office in dealing with contacts with zymotic fevers and the gradual reduction of quarantine Thousands of working days were formerly lost owing to the quarantine of contacts, but the policy of the Post Office had tended towards abolishing quarantine and permitting contacts to remain at work under medical supervision when they were in good health This policy had saved many thousands of days of quite unnecessary enforced absence Of 17 844 contacts of scarlet fever only one in every 251 had subsequently acquired the disease and of 17,436 contacts of measles only one in every 670

Chief Causes of Sickness

Finally Dr Bashford dealt with the chief causes of sickness and disability in Post Office experience About 30 per cent of all illness of both men and women was due to the catarrhal and respiratory group of diseases and about 10 per cent to the digestive disorder group The rheumatic group accounted for 10 per cent on the men's side and 4 per cent on the women's and the nervous group of disorders for 6 per cent on the men's side and 14 per cent on the women's A recent analysis

A NEW MEDICAL SCHOOL AT THE WEST LONDON HOSPITAL

OPPORTUNITIES FOR WOMEN STUDENTS

There are twelve hospitals in London with medical schools attached Of these one only (the Royal Free) is run in connexion with the London School of Medicine for Women and admits women students alone Of the remaining eleven schools nine are confined exclusively to men students Two (University and King s College Hospitals) admit a small proportion of women students, derived mainly from the corresponding Colleges (King s and University) of the University of London So far as men students are concerned the facilities in London may be considered adequate, though nearly all the schools have more applicants than they can place There does not, however, appear to be any real evidence of serious overcrowding

Women students who wish to study medicine in London are not so well off owing to their complete exclusion from nine of the twelve medical schools The London School of Medicine for Women absorbs a large number of the applicants, but the total number of students exceeds that which is regarded as the optimum for a medical school —namely, one student to every three beds University College accepts sixteen women students annually for pre-clinical studies, though only eight of these are subsequently admitted to the hospital Of the remaining eight not more than two may gain places by competition, so there are at present at least six every year who have to go elsewhere for their clinical training King's College does not admit more women for pre-clinical training than can ultimately be absorbed into King s College Hospital, it may be necessary, however, for some of them to wait for twelve or eighteen months after passing the Second M B Examination before they can be admitted to the hospital for clinical training

A considerable number of women students who would otherwise do their whole medical training in London fail to obtain entry to any school and have to go to a provincial university, and it is not always easy for them to find places It is still more difficult for those who have done the pre clinical period in London to get admission to a provincial school for clinical training only The position therefore appears to be that women are deterred from entering the profession and that London University is losing potential graduates to universities in the provinces Moreover, it may occasionally happen that a student will complete half her course and find it impossible to proceed to the final subjects for lack of educational accommodation in London and through inability to find it in other cities

The West London Hospital and Medical Education

Hitherto the West London Hospital has been exclusively a postgraduate school The Post-Graduate College began just over forty years ago and was the first school of its kind in London Shortly after the war the question of starting a central postgraduate medical school, financed from public funds and designed to attract medical men from all over the Empire and from foreign countries as well as from England, was discussed in Parliament and elsewhere Having decided in favour of the principle the authorities were faced with the difficulty of finding a hospital suitable for their purpose A number of the large voluntary hospitals were approached, but it was a condition that undergraduate teaching would have to be given up if they undertook the postgraduate work for the new school For this reason the hospitals with existing medical schools refused to consider the proposal The West London was next approached and, although it was a much smaller hospital than was required, its site of three and a half acres (the freehold of which is held by the hospital) made possible the necessary extensions and enlargements After some consideration the hospital accepted the offer, and plans were drawn up for a complete reconstruction of the present buildings and for development of those parts of the site which were not occupied for hospital purposes

These negotiations went on for a number of years and necessarily held up the various schemes for development which the board of the hospital had had in mind It was obviously useless to spend money on improvements until the complete reconstruction scheme for the new School should start Meanwhile the Act of 1930, transferring the old Poor Law infirmaries to the control of the county councils, became law The fact that an undertaking had been given to the West London Hospital (it had been announced in Parliament) that the new School was to be established at the hospital was of no avail Those in control of the scheme saw the opportunity of acquiring a reorganized municipal hospital for their purpose, and the West London board was informed that it had now been decided to establish the new School elsewhere

This was a great blow to the West London Through all the prosperous years after the war, when money was comparatively easy to come by, these negotiations had been going on Although it was in urgent need of improvements and extensions no appeal was made in view of the imminent reconstruction of the hospital for its new function Along with the passing of the new Act came the financial crisis The time for an appeal was unpropitious, yet the need had increased by the defects which had accumulated in the years of waiting Nevertheless the board went ahead with schemes for improvement and rebuilding

The Governing Body of the British Postgraduate Medical School decided to establish its school at the Hammersmith (L C C) Hospital, in the same borough as the West London In 1934 it opened its doors to students At this time those in control of the West London Post Graduate College were greatly concerned as to the future of the West London, with the new Postgraduate School supported by public funds competing with it almost on its doorstep It seemed likely that, in the long run, the West London would have to give way to its powerful competitor

The staff of the West London were well aware of the many advantages of a hospital having some sort of teaching institution attached to it and were loath to see their forty years of work for medical education wiped out Alternatives to postgraduate teaching were examined, and the question of becoming an undergraduate school was for the first time seriously considered The obvious need for further clinical facilities for women students was thought to offer a possible solution

Negotiations with London University

Late in June, 1934, the University of London was approached with the suggestion that the West London should become a School of the University for women medical students The authorities were clearly interested in the proposition, and the next step was to get the consent and co-operation of the board of the hospital This was willingly given at its July meeting In the following October the University sent a deputation to the hospital to inspect the facilities They expressed themselves as satisfied except for the pathological department, which was then housed in sheds (the needed increase in accommodation having been held up for the reasons already stated) It was pointed out that plans for a new building which included new pathological laboratories had been prepared and that building was about to start The new laboratories would be planned with a view to teaching and should be capable of accommodating all the students who were likely to be admitted

The main difficulty London University had to face was the supply of students It did not seem feasible to establish schools for anatomy and physiology at the

showed that (excluding the engineers) men between 40 and 60 incurred 55 per cent more sickness absence than men under 40, and women over 40 incurred 58 per cent more than women under that age The Post Office now employed a larger proportion of older men than formerly In 935 56 per cent of its male employees were over 40 and 25 per cent were 50 and over The average age of all retirements for ill-health on the men s side before the war was 43 , during the last few years it had gone up to 50 Dr Bashford also said that after more than thirty years' experience in the Post Office he thought that true malingering was exceedingly rare

SIR ARTHUR MACNALTY, who occupied the chair, said that his own impression was that the polyvalent anti-catarrhal vaccine took a certain number of years to "sink in,' but he believed that the vaccine did reduce the number of complications of the common cold In reply to Dr PERCY STOCKS who pointed out the extremely low rate of mortality among telegraphists as shown by the Registrar-General s figures, whereas the rate for male telephonists was about the average, Dr BASHFORD said that relatively few male telephonists were employed as compared with the number of telegraphists, and in view of the small numbers he did not think any significant deduction was to be made

THYROTOXICOSIS

At a meeting of the Liverpool Medical Institution on November 18, with the president, Professor R E KELLY in the chair, a discussion on thyrotoxicosis was opened by Professor HENRY COHEN and Mr J B OLDHAM

Professor Cohen doubted if it were possible to define thyrotoxicosis with greater accuracy than as 'a state of intoxication dependent on the thyroid" The clinical picture of thyrotoxicosis with increased metabolism and related effects could be reproduced by a continued intake of thyroid extract, but two features distinguished this type of experimentally induced hyperthyroidism from Graves s disease (1) there was no change in the structure of the thyroid gland, and (2) there was no exophthalmos Administration of the thyrotropic hormone of the anterior lobe of the pituitary, however, produced characteristic changes in the thyroid gland with colloid loss, a change in the epithelium lining the vesicles from a cuboidal to a columnar type, a decrease in the iodine content of the gland itself, and an increase in the iodine content of the blood and urine Moreover, exophthalmos resulted even in thyroidectomized animals, though it was absent after the superior cervical sympathetic ganglia were removed That these effects of thyrotropic hormone were temporary had been shown to be due to the development of an anti-thyrotropic principle in the blood, which inhibited the stimulation of metabolism by the thyrotropic hormone, though it had no effect on the increase in metabolism caused by thyroxine Normal animal and human blood had a slight inhibitory effect on the thyrotropic hormones, while the blood of a patient suffering from Graves s disease had none Recently the anti-thyrotropic principle had been obtained in powder form, and it was clear that its effect was not due to iodine He had seen many cases of acromegaly with associated thyrotoxicosis On the other hand where the pituitary gland had been examined in fatal cases of thyrotoxicosis no gross definable pathology had been observed Caution, however, was necessary in interpreting these negative findings because very slight changes might produce gross body disturbances, as was evidenced by the effect of a minute basophil adenoma of the anterior lobe of the pituitary

Difficulties in Classification

An attempt had been made to divide cases of thyrotoxicosis into two main types (1) Graves s disease, associated with a diffuse hyperplasia of the thyroid and exophthalmos, occurring in young patients with marked nervous symptoms and subject to spontaneous remissions and relapses, and (2) Plummer s disease, in which the goitre was nodular and eye signs were absent, occurring in older patients with predominantly cardiovascular signs and being usually more progressive in its manifestations It had been suggested that the former cases were more likely to have a pituitary origin while the latter were true examples of hyperthyroidism Typical examples of these two main types did exist, but many cases had features common to both groups , even with nodular goitre there were diffuse hyperplastic changes in the non adenomatous areas of the gland These attempted classifications took little heed of the rate and intensity of action of the toxins or of the soil on which they were acting It was important to recognize that thyrotoxicosis appeared in various guises which overshadowed the classical features These types of so-called "masked ' thyrotoxicosis were, in his experience, mainly (1) cardiovascular, in which auricular fibrillation, hyperpiesis, or cardiac failure might be the presenting symptom , (2) cases with rapid wasting, especially seen in middle-aged males with a good appetite, so that when associated with slight glycosuria a mistaken diagnosis of diabetes mellitus might be made , (3) with diarrhoea, and rarely any other gastro intestinal disturbances, though intractable vomiting had in a few cases been the main symptom , (4) cases with psychotic manifestations , and (5) with nervous manifestations, of which ophthalmoplegia and amyotrophic lateral sclerosis were the most important though rare examples

He regarded psychic trauma, infections, sex cycles, reducing cures, etc , as being activating but not fundamentally causative Estimations of the basal metabolic rate were unnecessary for diagnosis, the factors of paramount importance being the duration of the toxaemia and its effect on the tissues, which could be estimated only by clinical observation He thought that Plummer s work on iodine had revolutionized the therapy of thyrotoxicosis While in the mild case in which psychogenic activation played a part rest, iodine and x-ray treatment might result in cure, in the majority of cases a subtotal thyroidectomy, after adequate preparation, was the treatment of choice, and should not be delayed The results in cases conforming to the Graves s type were perhaps less satisfactory than in those of the Plummer type All cases should be carefully followed up, and residual or recurrent thyrotoxicosis dealt with immediately Surgery, however, still remained a confession of failure, and he hoped that work on the part played by the pituitary in thyrotoxicosis might eventually lead to a more rational therapy

Subtotal Thyroidectomy

Mr J B Oldham said that while the immediate mortality in reputable clinics from subtotal thyroidectomy had fallen almost to vanishing point, and some 90 per cent of the patients were rehabilitated, in some cases the exophthalmos was not cured and mild subjective symptoms remained Iodine should not be used in the non operative treatment of toxic goitre except in such acute emergency as thyroid crisis It was unfortunate that many members of the profession had the impression that iodine was a curative agent, and, given a false sense of security by the temporary benefits derived from its use, they persevered with non-operative treatment until the best moment for surgery was long past Iodine given for weeks or months lost its power to improve the patient and so its help was not available when it was most needed —at the time of operation During the last four years he had operated on 186 cases and had had three deaths He had used avertin with gas and oxygen anaesthesia in all but one case, and this was the only one in which there were any pulmonary complications He used the diathermy knife for the skin incision and for dissecting up the skin flaps As a rule he did not divide either the

West London such a project would have been too expensive for the relatively small number of students concerned On the other hand, the number of students who passed their Second M B in London and were unable to find accommodation for clinical study was not great There were the six to eight students from University College who annually failed to get places in University College Hospital There might also be a very few from other sources, but it did not seem likely that a full entry (twenty-five students a year) could be obtained unless accommodation for more students to do anatomy and physiology was found either in existing departments or by the formation of a new one

This matter is still having the attention of a special committee of the Court of the University Early this year, however, the West London had a number of applications from women students at University College who were approaching their Second M B Examination in March without any certainty of getting places in the hospital *They had heard of the developments at the West London,* and wanted to know whether they could do their clinical studies there if they failed to get into University College Hospital They were told that it entirely depended on whether London University would recognize the hospital for the purpose and it was promised that the matter should be at once taken up with the University The University, however, had no powers to grant to a hospital *ad hoc* recognition for individual students A solution of the difficulty was found by the Council for External Students, which proposed to the Senate at its July meeting that the West London should be recognized as an institution approved for the purposes of the M B , B S degree for external students (clinical work only) This was passed by the Senate but any resolution involving recognition of a medical school requires (by the Statutes of the University) the approval of His Majesty in Council As no Privy Council meeting was to be held until October the recognition could not become official before the beginning of the academic year

In the meantime the applicants from University College had grown weary of delays and most of them had succeeded in getting places in provincial medical schools Three students, however, had failed to gain entry into any medical school or for various reasons could not pursue their studies away from London These were accepted by the West London subject to the approval of the Privy Council being forthcoming, and actually started work on October 1 this year In addition one other student who had had to go to Leeds for clinical work and who had done about a year at that university was also accepted, and started work on the same date In due course the approval of the Privy Council was obtained and the position was thus regularized

The West London and the Future

The present arrangement with the University of London is regarded as only a temporary one It is expected that in due course full recognition as an internal school of the University will be granted This will take place when the committee of the Court that is exploring the ground as to the teaching of anatomy has found a solution of the problem, which has already been mentioned

The University of London is not however the only examining body with which London students are concerned Most of the men and women from Oxford and Cambridge prefer to do their clinical work in London and recognition by these two universities has just been granted Application has also been made to the Committee of Management of the Conjoint Board of the Royal Colleges as well as to the Society of Apothecaries and it is assumed that these bodies will follow the lead of the universities

The recognition from the Universities and Colleges has of course, no reference to the sex of the students So far as they are concerned both men and women may study at the West London Nevertheless the new venture has been designed specially for the benefit of women students and it is to be anticipated that the majority of students seeking admission will be women There is no present intention of confining the school to women students and men applicants will be considered on their merits It is well known that women prefer to have their medical education with men, but that the men prefer isolation The experiment of admitting women was tried after the war by a number of medical schools in London and was abandoned in all except the two already mentioned, which have ties with the corresponding Colleges of the University The future development of the West London School in this respect cannot be foreseen, but it would seem only reasonable not to bar the way to a metropolitan medical school which would accept men and women without discrimination

It is not possible to teach graduates and undergraduates *in any numbers in the same hospital For this reason* the ultimate policy of the West London is to give up its postgraduate work , but there is no intention of doing this immediately The Post Graduate College is handling more students at the present time than it has ever done, and the need for such work is becoming increasingly apparent Until the future of the undergraduate school is assured and a full entry obtained the two types of teaching will have to go on together, though every effort will be made not to let them interfere with each other

It must be obvious that the West London cannot yet offer the facilities that the older teaching hospitals possess The Post-Graduate College has quarters in the main hospital building, and these are being used for the time being Sooner or later new medical school buildings will be needed and there is ample space for these on the hospital property The financing of such an extension may present difficulties but it is hoped that public-spirited people interested in the future of the medical education of women may be persuaded to provide the necessary funds

Clinical Facilities

The clinical facilities are excellent The out patient department already deals with a larger number of patients than several of the existing medical schools, and there are 239 beds for in patients Allowing for the optimum number of students—the figures already mentioned namely, one to every three beds—the School should be able to provide accommodation for between seventy and eighty students The entry for any year, therefore, should not exceed thirty and would normally be about twenty-five this is taking into consideration that the clinical period now occupies three years and that a certain amount of wastage must be expected—more so with women than with men It is hoped that this number will be made up from students from the three Universities of Oxford Cambridge and London, the last named contributing the larger proportion

There is no maternity department at the hospital arrangements are therefore being made for this part of the training to be carried out in co operation with an adjacent county council

It is recognized that a medical school must offer the usual house appointments to its students and these will be available as soon as suitable students become applicants Moreover the question of considering women for staff appointments has been discussed and it has been agreed that this will have to be done in due course There is nothing in the regulations of the West London Hospital to exclude women from either house or staff appointments

---

The King has granted Dr Austin William Byrne authority to wear the Order of the Nile Insignia of Commander conferred upon him by the King of Egypt in recognition of valuable services rendered by him in the employment of the Egyptian Government.

platysma or infrathyroid muscles In every case in this series a one stage subtotal resection had been done and it was his belief that the less thyroid left behind the less the likelihood of a post-operative crisis or residual symptoms He had found that he was draining fewer and fewer cases, and that the most perfect scar was given by interrupted eversion sutures of silkworm gut removed on the second or third day after operation Mr Oldham admitted that he followed the usual habit of giving iodine after operation though he failed to see the logic of this provided full iodinization had been produced before operation and a sufficient amount of the gland had been removed

Carbohydrate Metabolism

Dr ROBERT COOPE discussed the association of hyperthyroidism with disturbances of the pancreatic function In 1912 Cohn and Peiser recorded five cases of inflammation of the pancreas accompanied by hyperthyroidism while Holst Garrod and several other writers had described cases of hyperthyroidism in which at necropsy atrophy and other lesions of the pancreas were revealed The association of glycosuria with hyperthyroidism was moderately common but when looked for over a large series of cases was by no means as frequent as was sometimes assumed John (1928) found hyperglycaemia in less than 10 per cent of his cases of hyperthyroidism and noted that the loss of sugar tolerance did not run at all parallel with the severity of the hyperthyroidism In his experience true diabetes mellitus accompanied by hyperthyroidism was very rare In the last few years he had seen only three diabetics all under 35 in whom careful examination revealed a real but quite mild hyperthyroidism They were given x ray therapy to the thyroid gland, two of them who previously needed 12 to 15 units of insulin daily to keep them standardized were afterwards able to take the same controlled diet without any insulin while the third was enabled to reduce his daily dose from 50 to 17 units They were cured of their hyperthyroidism but they still remained diabetics

Mr PHILIP HAWE Professor JOHN HAY Dr T F HEWER, and Dr G F RAWDON SMITH also contributed to the discussion which was concluded by Dr ROBERT KEMP Dr Kemp said that in a group of ninety cases followed up after operation it was found that in 70 to 80 per cent of the nodular toxic group a complete cure had resulted whereas there were residual symptoms in all but 30 to 40 per cent of the diffuse toxic group The toxicosis of a nodular goitre seemed mainly thyrogenic so that thyroidectomy was fairly rational and gave good results On the other hand the picture of diffuse toxic goitre resembled the experimentally produced pituitary thyrotoxicosis Here where the principal mechanism was untouched operation was not so likely to be successful and it was in such cases that Loeser's anti thyrotropic substance would probably be of great value At the same meeting Dr J M H SMELLIE described in detail a most interesting case of acute myelogenous leukaemia

Inquiry into Croydon Typhoid Epidemic

The Ministry of Health states that the inquiry to examine the causes leading up to the outbreak of typhoid fever in Croydon and the steps taken to deal with it will open at the Town Hall Croydon on Monday December 6 at 11 a m As already announced it will be held by Mr H L Murphy K C who will have as assessors Sir Humphry Rolleston Bt M.D, and Mr H J F Gourley, M Inst C E The inquiry will be a public one and Mr Murphy will be prepared to receive the evidence of any persons interested in the subject matter of the inquiry

Voluntary Blood Donors

The fifth annual dinner of the Voluntary Blood Donors Association took place on November 25 with the chairman Mr A J Carpenter presiding More than 200 people were present of whom 122 were members of the service accounting for 4 per cent of the blood donors in the country It was mentioned that these 122 members had between them given 1 726 transfusions an average of 15 per donor A message was read from the King assuring the members of his deep interest in their splendid and self sacrificing service The toast of The Visitors was proposed by Mr A M A Moore F R C S and responded to by Sir Kaye Le Fleming M D Chairman of Council of the British Medical Association who referred to the common bond of interest between the medical profession and the blood donors in their solicitude for the patient The medical profession he said was a little apt to give service freely without expecting much acknowledgement and that was their only excuse for not more generously acknowledging in a public way the splendid service rendered by blood donors Sir Kaye Le Fleming went on to suggest that the service given by members of the Voluntary Blood Donors Association was likely to develop in ways which up to now had not been realized After recovery from a disease the blood was so to speak educated for the particular complaint Perhaps it might prove desirable to arrange for a further grouping of donors in relation to the diseases from which they had successfully recovered Results obtained in the treatment of measles showed that serum from a person recently recovered from the disease was of more value than serum from one who had had measles at some earlier time Mr P L Oliver secretary of the Blood Transfusion Service of the British Red Cross Society said that he had recently attended the International Blood Transfusion Congress in Paris (of which a report appeared in the *Journal* of November 6 p 923) and after learning of the practice in other countries he could only say that his belief in the voluntary service obtaining here had in no way diminished In their own service it had been decided that four transfusions a year was the maximum which a male donor should be allowed to give and that females should only serve after four monthly intervals He added in view of what Sir Kaye Le Fleming had said that it had been possible to prepare a short list of adults who had had measles and whose blood was available for prophylaxis in connection with that complaint Mr A J Carpenter said that the association was representative mostly of the London service and had been formed to safeguard the interests of blood donors and to co operate in making the service as efficient as possible It had been suggested that the sphere of usefulness of blood donors was likely to be widened There was certainly much more research to be done and the association was proud to have the services of Dr Brewer Mr Moore and Dr Riddell as members of a technical subcommittee to inquire into future possibilities Dr H F Brewer, medical

Nova et Vetera

BARÓN ALIBERT

At a meeting of the Section of Dermatology of the Royal Society of Medicine on November 18 Dr J D ROLLESTON read a paper on the life and work of Baron Alibert on the occasion of the centenary of his death

Alibert was born on May 26, 1768, and studied medicine in Paris, where he qualified in 1799 with a thesis on pernicious fevers of which several editions were published His rise in the profession was remarkably rapid, as two years after qualification he was made assistant physician and in the following year full physician to the Hôpital Saint-Louis In addition to several books on diseases of the skin, of which the most important was published in parts between 1806 and 1814 and in which coloured plates appeared for the first time in the history of dermatology, he was the author of a work on therapeutics, of which he was the first professor in the Paris Faculty, and won the Montyon prize for a work on the physiology of the passions, which was translated into German and Spanish He was physician to Louis XVIII and Charles X, who created him a baron His death, due to cancer of the stomach, took place on November 4, 1837

Dr Rolleston attributed Alibert's high rank in the history of French medicine generally and of dermatology in particular to the following circumstances among others In the first place he established the first independent clinic for dermatology in France Secondly, he described several new diseases, including mycosis fungoides, Aleppo boil, keloid, and acromegaly, and invented new terms—namely, syphilides dermatosis, and dermatolysis, as well as many others which have not survived Thirdly, though not to be compared with Trousseau, his successor in the chair of therapeutics, he was by no means a therapeutic nihilist His textbook on his subject had no rival for over thirty years, and its merits were recognized by several of his successors in the same chair Lastly, he made the Hôpital Saint-Louis the Mecca of dermatologists throughout the world

JOHN GRAHAM, APOTHECARY OF CARLISLE

On Thursday, November 14, 1745, John Graham, apothecary of Carlisle, stepped into history The story is told by Dr Waugh, Chancellor of the Diocese of Carlisle, who is quoted by G J Mounsey in his *Account of the Occupation of Carlisle* in 1745

'Some time after we were in the Castle towards evening, the Mayor came to demand the Keys of the Town as Col [Durand] had retired into the Castle and John Davinson, merchant, John Graham, apothecary, and Doctor Douglass, a physician, were sent out [to Prince Charles Edward's camp] as I apprehended, the two former at the request of the Mayor and inhabitants and the last at the request of the Militia Officers he being a volunteer in Sir J Pennington's Company

About ten o clock the messengers returned and said that the flags had been sent to the Pretender's Son at Brampton, and that the answer was that he would grant no terms to the Town, nor treat about it at all unless the Castle was surrendered

This apothecary probably had the remarkable experience of seeing and speaking to such notable characters as the Young Pretender, Mr 'Evidence' Murray, and Lord George Murray

There is in the collection of Dr T Hare a pressed horn snuffbox of eighteenth century workmanship, bearing the name of Graham, apothecary Carlisle, and the arms of the Lumber Troop (a society with members in London and the provinces)

Graham died on June 25, 1757, at the age of 49, and was buried in St Cuthbert's Church, Carlisle

W BRYCE MCKELVIE

BIBLIOGRAPHICAL REFERENCES

A NOTE FOR CONTRIBUTORS TO THE B M J

Starting with the issue of January 2, 1937, the *British Medical Journal* adopted the Harvard system of giving references to scientific literature, and used the abbreviations of names of scientific periodicals which are included in the *World List* This system, which has been slightly modified, is as follows

References in the Text

1 Numbered references in the text are not used, although with an exceptionally long list of references this rule might be relaxed

2 Instead of a "superior numeral" the author's name and the date of the publication are given in brackets

EXAMPLE A

Old style = It has been said[1] that coma in heart disease is rare

Harvard system = It has been said (Jones 1935) that coma in heart disease is rare

EXAMPLE B

Old style = Dale and Dudley[2] isolated acetylcholine from animal tissues

Harvard system = Dale and Dudley (1929) isolated acetylcholine from animal tissues

In other words, when the author's name is part of the sentence only the year of the publication referred to is to be in brackets When more than one paper by the same author is published in any one year each paper should be distinguished by a small letter—a, b, etc—placed after the date—for example, (Brown, 1935a)

References at End of Paper

1 These references are not numbered, with the possible exception of a long list of references

2 Authors' names are arranged in alphabetical order

3 The year of publication is given in brackets after the author's name

4 The title of the periodical is printed in italics and abbreviated in accordance with the *World List of Scientific Periodicals*

5 The volume number is printed in Arabic numerals in bold face type, this is followed by the first page number of the paper quoted

6 When the title of a book is referred to, the name of the publisher, the place of publication, and the number and date of the edition should be given when possible

7 When an author's name is repeated in the list of references a short line represents the repeated name

EXAMPLE

'In contrast to these results O'Brien (1932) and Yudkin (1933) report that cataracts only occur in rats deprived of vitamin B, at an early age and not in older animals, while in this country Bourne and Pyke (1935) carefully repeated the work of Day and Langston (1933) and obtained an incidence of cataract of only 31 per cent Bourne and Young (1934) have made a discovery of great importance in showing

officer to the association, said that a point of interest noted at the Paris Congress was that the delegates were unanimously agreed that blood groups, once established, remained constant In the matter of storage of blood the service in this country was backward Citrated blood could be given with safety to a patient two or three days after removal from a donor, but there was little first-hand knowledge or experience of the use of blood kept for a fortnight or so Citrated blood was being used in France and Spain up to fifteen days after collection

Sheffield Medical Dinner

The annual dinner of the medical profession in Sheffield was held at the Royal Victoria Hotel on November 25, when Professor A E Barnes presided over a gathering of about one hundred and sixty This year for the first time the wives of members and other lay guests were invited The chief guests were to have been Dr Halliday Sutherland and Dr Gilbert Forbes, the recently appointed police surgeon of Sheffield but Dr Forbes was prevented from attending Dr A Gurney Yates, in proposing the toast of Our Guests, welcomed Dr Sutherland as his contemporary and fellow graduate at Edinburgh University He had done pioneer work in the branch of medicine that he had made his own He had won fame, too, in other fields, having led a life of adventure, and written some delightful books—that were never dry—which many of them had read He had the faculty of keen observation, and ' a wonderful facility for manipulating with the hand of an artist the light and shade of human affairs Referring to Dr Gilbert Forbes, Dr Yates said that he too was a Scot, for whom he prophesied a distinguished career and who could be assured of the support of his colleagues in Sheffield Dr Halliday Sutherland, replying to the toast, thanked them for the honour done him and said that these dinners were of real value in bringing the members of the profession into personal contact One of the biggest of our troubles in the present day was the future of general practice It was a modern heresy that every change meant progress It would be a very bad thing if the general practitioner ceased to practise and became a mere cipher So many things were being taken over by the municipal health services or by the State, and less and less was getting left for the general practitioner to do Speaking of hospitals, Dr Sutherland said that in London most of the old hospitals were antiquated buildings, built on highly expensive sites and in the midst of petrol-laden air It is time, and more than time, that the old sites were sold and the hospitals were rebuilt in the green belt amidst the comparatively open country around London ' At the same time it would be well if the plurality of appointments held by some members of their staffs were given up, so as to make room for others The toast of The Chairman " was proposed by Dr A Bremner, and in replying Professor Barnes referred to the debt which the profession in Sheffield owed to the secretaries of their various organizations—the Sheffield Division of the B M.A , the Panel Committee, and the Yorkshire Branch of the B M.A — and particularly on this occasion to Dr T E Gumpert, the secretary of the medical dinner committee

Society of Apothecaries

A Yeomanry Dinner of the Society of Apothecaries was held at the hall of the society on November 23 After the loyal toasts had been drunk, Mr H. L Eason, Principal of the University of London proposed The Society of Apothecaries Mr Eason said that the society had been founded about 1617, and he quoted several authors whose writings bore upon the traditions which it had maintained from that time up to the present day, the authors he referred to ranging from John Earle in 1628 to Robert Louis Stevenson and Earl Baldwin In responding to this toast the Master Mr Hugh Lett, said that the last twelve months in the society s history had been made remarkable by the conferment of the freedom of the society upon Lord Nuffield and Sir Farquhar Buzzard, on whose shoulders had fallen the onerous responsibilities involved in the administration of Lord Nuffield s munificent gift to Oxford He traced the history of the Apothecaries Society, particularly so far as it concerned the gradual advancement of medical education It was the society that had initiated the process of ' signing up " which had so often taxed the ingenuity of students and the credulity of deans of medical faculties The present curriculum he thought overloaded, so much so that it was becoming questionable as to how far cramming was being encouraged at the expense of the culture of thought and reason The Senior Warden, Dr Reginald H. Hayes, proposed " The Guests," and delighted his listeners with the story of the lozenge which Mr Justice Hawkins gave to Professor Pepper, and which did so much to enhance the reputation of the old pharmacy of the apothecaries in Water Lane Among the many distinguished guests were Professor R J Johnstone, President of the British Medical Association, Sir John Megaw, Surgeon Vice Admiral P T Nicholls, Sir Arthur MacNalty, Lieut -General Sir James Hartigan, Sir George Chrystal, Sir Francis Fremantle, Sir Buckston Browne, and Air Vice-Marshal Sir Alfred Iredell, with the deans of sixteen medical schools, and the presidents of the Medical Society of London the Harveian Society, the Society of Medical Officers of Health, and the Pharmaceutical Society On their behalf Mr Justice Humphreys, president of the Medico-Legal Society, and Mr E A Crook, dean of the Charing Cross Hospital Medical School, replied to the Senior Warden s toast

Radium Beam Therapy Department in Birmingham

On November 26 a department of radium beam therapy research was opened at the General Hospital, Birmingham, by Sir Cuthbert Wallace, P R C S This is the latest development in a programme of extension and modernization of the department of radiation therapy begun in 1934 The unit at present contains two grammes of radium, of which one gramme has been presented to the hospital by Lord Austin, while the second gramme has been lent by the National Radium Commission, who have also promised to lend a further gramme in six months time The apparatus has been designed in collaboration with Radium Beam Therapy Research, and incorporates the results of their experiences, together with such improvements, particularly in methods of distance control, as make it one of the best in the country Special attention has been given to safeguarding the patients and the staff from injury by unnecessary radiation, and allowance has been made in this respect for a possible increase to twenty grammes in two units at a later date This part of the design was made considerably easier by the fact that a " bungalow " type of ward, separate from the main hospital, was made available for the installation of the unit The radium itself when not in use is housed in a lead safe, with walls ten inches thick, and is conveyed to the container, after it has been suitably adjusted to the patient, by air pressure, and is returned to the safe automatically, by vacuum, on the completion of the treatment period The beam is produced by means of an opening in the lead container, to which is fitted an applicator made from special tungsten alloy developed as a result of research by the General Electric Company in their laboratories at Wembley This alloy, while possessing a very high protective value, has considerable advantages in price over both platinum and gold (a pound of it costs roughly twenty shillings) and is far superior to lead in toughness and density, so that it provides an admirable material at a reasonable price where protection without bulk is required, as for example, in approaching any concave surface, such as the root of the neck or the submental region It would appear, therefore, that this alloy, by providing for more strict localization of the beam, with less bulk than has hitherto been possible, may present a distinct advance in the design of beam therapy apparatus Three movements of the beam are available, as in the

Stockholm and Radium Beam Therapy Research units The amount of radium available will make it possible to work with a radium surface distance of eight and a half centimetres It is, of course important to make this distance as great as is compatible with a treatment time which the patient can tolerate so as to improve the relationship between the surface and deep intensities (that is, to improve the tumour dose, as compared with the dose to overlying skin)

Manchester Joint Hospitals Board

The second annual report of the Manchester Joint Hospitals Advisory Board gives evidence of the valuable work which is being done by a board so constituted as to include representatives of the City Council of Manchester, the Voluntary Hospitals Council the University, and the local Division of the British Medical Association Statistics are being compiled and questionaries are being sent out which, when collected, will give all the information necessary for the consideration of the problem of reducing hospital waiting lists The possibility of overlapping in the waiting lists of the various hospitals has been gone into, and, surprisingly enough, it appears that no more than eight patients have their names on the waiting lists of two or more hospitals in Manchester A point that will be of importance in the compilation of future statistics is the need for a system of nomenclature in the classification of diseases which will be used by all the hospitals with which the Board is concerned The Board has further considered the question of the unification of orthopaedic services, and an account of the working of the fracture service of the Royal Infirmary has received consideration There were approximately 5,400 new fracture cases dealt with in Manchester during 1935, and from an analysis prepared by Mr Harry Platt it is estimated that in each future year there will be at least 5 000 new fracture cases Figures taken from the records of the fracture clinic at the Infirmary reveal that approximately 18 per cent of the fractures dealt with follow-street accidents in which a moving vehicle is concerned, 12 per cent are industrial, and 20 per cent arise as a result of domestic accidents or accidents in the course of sports or games A question which has been referred to the executive committee of the Board is the reduction of working hours of nurses Apart from the financial considerations affecting the various hospitals the whole problem is a difficult one and is inevitably bound up with the larger question of recruitment No major decision on matters of policy has been arrived at during the year under review owing to the complexity of the various problems but it is clear from the report that valuable work is being done the results of which will become apparent in a few years time Copies of the report can be obtained free of charge from the joint honorary secretaries the Town Clerk Town Hall Manchester 2 and Mr R L Newell, M D F R C S, 2, St John Street, Manchester

Tuberculosis in Lancashire

Dr G Lissant Cox central tuberculosis officer to the administrative county of Lancashire states that in 1936 the death rate from pulmonary tuberculosis (0 46 per 1 000) was the same as in 1934 and 1935 the lowest on record and that the number of new cases reported had again dropped In regard to non pulmonary forms the death rate (0 1 per 1 000) was the same as in 1935 the lowest on record but the number of new cases reported had risen slightly Diagnosis and treatment of tuberculosis is provided free in the administrative county and the net expenditure on the tuberculosis services for the year 1936-7 was £195 075 equal to a rate of 4 75d in the £. Dr Cox reports the results of an investigation bearing on the diagnosis of tuberculous patients in the early stages of the disease The records of two groups of patients were analysed (a consecutive number of deaths from pulmonary tuberculosis in the county occurring in 1920, and a corresponding series of deaths in 1935) in regard to (1) the average duration of illness up to the time of consulting a medical attendant (2) the average period under the care of the medical attendant before being first examined by the tuberculosis officer and (3) the average duration of life after examination by the tuberculosis officer The respective figures found under these three heads were 11 7 5, and 18 3 months in 1920 and 9 5 3 and 27 4 months in 1935 The good relations existing between the administrators of the tuberculosis scheme in the county and the general practitioners are illustrated by the fact that 92 per cent of the new cases (excluding contacts) were sent before notification to the tuberculosis officers for an opinion as to diagnosis and treatment The excellent work carried out by the dispensaries is shown in the following table, in which are given figures comparing Lancashire with all counties in England calculated per 100 deaths from tuberculosis

	Lancashire	All counties in England
Total new cases and new contacts diagnosed as suffering from tuberculosis and receiving treatment under the official scheme	162	141
Number of sputum examinations	516	368
Number of x ray examinations	999	414
Number of home visits by health visitors	4 013	2,542
Number of cases remaining undiagnosed at the end of the year	3	26
Number of cases removed from the dispensary registers as recovered	62	51

The sad note of the report is found in the section on housing conditions Of 1 856 patients over 15 with the pulmonary form of the disease considered infectious 469 occupied a separate bed but not a separate bedroom and seventy five not even a separate bed Among 2 243 similar patients considered not infectious' the corresponding figures were 440 and 652

IRELAND

Irish Free State Medical Union (I M.A and B M A)

At the last meeting of the Council of the Irish Free State Medical Union Dr MacCarvill was elected vice president for the year 1937–8 and took the chair at the meeting in the absence of the president It was announced that Mr C MacAuley was not prepared to seek re election as honorary treasurer and Dr Frank Lavery (Dublin) was unanimously elected in his stead the meeting expressing its appreciation to Mr MacAuley for his past services Dr J P Shanley was re elected honorary secretary for the year The resolution of the annual general meeting instructing the Council to press for a standard salary of £300 rising to £500 for all dispensary medical officers was discussed and after substituting the word minimum for standard the Council decided to refer the resolution to the Dispensary Medical Officers Group Committee for consideration and suggestions and to give full support to that committee should it decide to send a deputation to the Minister for Local Government and Public Health A series of resolutions from the Connaught Branch were referred to the executive committee which was given power to take such action as it considered necessary The resolutions dealt with (1) fees for attendance at inquests and for post mortem examinations by doctors employed in institutions and fees and assistance for post mortem examination by dispensary doctors (2) fees for dispensary and hospital locumtenents (3) acceptance by a Board of Health of the substitute nominated by a doctor in the employ of the Board (4) travelling and subsistence allowances for Council members attending meetings of the Council and (5) payment of fees to medical attendants in workmen's compensation

to Dr David Little, an association which was to be continued for a long period After seven years in residence there he took the F R C S.Ed in 1896, and started private practice in Manchester as an ophthalmologist He became, in succession to Dr Little surgeon and later consultant surgeon to the Royal Eye Hospital, and he was a lecturer in ophthalmology and ophthalmic surgeon to the Manchester Royal Infirmary He did a great deal of pioneer work on the subject of refraction and on the field of vision A member of the Ophthalmological Society and of the Manchester Medical Society, he had also been a member of the British Medical Association for forty-three years, being appointed secretary of the Section of Ophthalmology at the Annual Meeting in Manchester in 1902 and vice president of the same Section at Belfast in 1909 He contributed several papers to the specialist journals and a chapter on diseases of the choroid and vitreous to Oliver and Norris s *System of Diseases of the Eye* Dr Hill Griffith had a large measure of success in his professional work, and always enjoyed the confidence of his colleagues and his many patients He was, too, an inspiring teacher, and his postgraduate classes at the Royal Eye Hospital were always among the best attended On retiring from active practice he went to live at Woking soon after the war and developed there the interests he had always maintained in golf and music He is survived by his younger brother, Dr T Wardrop Griffith of Leeds, and by several nephews and nieces

Universities and Colleges

UNIVERSITY OF CAMBRIDGE

The Faculty Board of Medicine has appointed Dr G S Graham Smith, Dr G H. Orton Dr Ff Roberts, Dr F G Spear, Mr R Williamson Dr E. P Cumberbatch Dr P J Kerley, Dr W P Philip Dr R J Reynolds and Professor S Russ to be members of the Committee for Medical Radiology and Electrology for the year 1938

Sir Patrick Laidlaw B Chir F.R.C.P F R S has been appointed Rede Lecturer for 1938

At a congregation held on November 27 the following medical degrees were conferred

M D—S K Sen J L Lovibond, L P Marshall

M B, B CHIR.—D H Davies *W H R Jeremy, J R Owen, C H T Bond, L R King G G Ludgater D D Keall

MIDWIFERY —B Berman E. E Buckler H S A. Corfield T Gadian B A. Hoogewerf

The diploma of the Society has been granted to J D Anderson, J D Buckner T Gadian B A. Hoogewerf H D Lamb G Macbain, F W McKenna and R. A Stenhouse

Medico-Legal

A PEST OF PRACTICE

One of the trials which sometimes beset the general practitioner is the fanatical patient who takes a dislike to him and follows him round, insulting him and damaging his property or spreading scandalous reports about him It is always difficult to know what to do with these people—to do anything with them is bound to mean unpleasant publicity A typical instance came before Mr Justice Macnaghten at the Lincolnshire Assizes last month

A Skegness doctor complained that while he was attending an old lady her daughter "in a somewhat intoxicated state threw a quantity of cold water over him and drenched him, threw empty beer bottles at him, and smashed all the glass in his car windows After he had telephoned to the police she threw a number of large stones at him A few days later she wrote him a letter in the course of which she said "Darling, you must keep your promise and marry me and shortly after that an announcement of an engagement between the doctor and the girl appeared in the local paper She also sent him postcards through the post, one of which bore the word seducer He thereupon charged her with assault, damage to property and criminal libel He denied in court that he had ever taken the girl in his car gone for walks with her or had any kind of relationship with her The girl in giving evidence said that the doctor had attended her as a patient and had said he would like to marry her He had afterwards seduced her and had had sexual relations with her on several other occasions. Two days before the assault he said he had had enough and was not going to marry her and that if there was any nonsense he would have her mother certified She admitted having had some drink on the day of the assault, and pleaded guilty to the assault and the damage She said she had sent the postcards to the doctor because she had thought they were true In cross-examination she admitted that she had done the same thing before in 1928 she and her mother had broken up the other doctor s car and she had accused the doctor of seducing her and had assaulted him The medical officer of Lincoln prison said that the girl suffered from hysteria a condition which often gave rise to accusations of this kind The learned judge said in summing up that there was no evidence for her terrible accusations and that the prison doctor s evidence explained how she had come to make them. In her own interest and in the public interest she must go to prison for nine months

In this case therefore the doctor was able to deal effectively with a very serious nuisance and danger A prosecution for criminal libel however always has the disadvantage that it must be tried at assizes This may mean a delay of several weeks and a certain amount of expense and loss of time Doctors owe to a certain solicitor of large experience in medical protection a simpler means of countering the "poison pen Conduct of a character calculated to produce a breach of the peace is an offence which by the Summary Jurisdiction Act 1879 s 25 can be tried by a bench of magistrates at once They can either bind over the offender or send him to prison and the doctor s name need not be mentioned This procedure has been found useful on more than one occasion and has the added advantage that if the writer is mentally disordered he may be remanded and certified From the reports of this case in the daily press* the accused was apparently suffering from some form of mental disorder This however does not necessarily mean that the learned judge was wrong in sending her to prison She had been medically examined and his lordship doubtless had the benefit of thoroughly competent advice as to her treatment It is probable that if she had been certifiable she would have been certified and a stiff prison sentence with enforced abstinence from drink may prove beneficial.

* *Times* November 9 and 10 *Daily Telegraph* November 10

cases settled out of court It was also agreed at this meeting to represent to the Local Appointments Commissioners that dispensary medical officers should be represented on the Selection Boards in the case of dispensary appointments

A Tribute to Irish General Practitioners

Sir William de C Wheeler, speaking at a clinical dinner in connexion with the Southend on-Sea General Hospital on November 23, referred to the role of the general practitioners in the body politic and their heavy responsibilities He paid a tribute to the work of the general practitioners in Ireland during the period of fighting and unsettled government He described how the general practitioners in that country had carried out their duties under conditions which would make those trained in the profession of arms shrink and retreat It was no light matter to travel over roads strewn with mines and explosives at the dead of night, nor was it a joy-ride to go through ambushes and trenches of necessity by forbidden routes The doctors were often mistaken for combatants and fired on by friends and foes Some fell wounded, some were killed, others escaped with their cars blown up and destroyed There was never an instance of refusal to attend a patient when the summons was received The general practitioner would hold an honoured place when the tempestuous times through which Ireland had passed were chronicled by the future historian Visits to the Mayo Clinic and the methods adopted by various Continental leaders were subsequently described by Sir William Wheeler, who laid emphasis on the debt of the present generation to British surgeons of the calibre of Macewen, Bland-Sutton, Moynihan, Lane, Trotter, and Stiles

Typhoid Fever in Donegal

An outbreak of typhoid fever is reported to have taken place among the patients in Donegal Mental Hospital, Letterkenny, an institution housing 700 patients More than seventy cases had been confirmed at the beginning of this week with four deaths The patients include three members of the staff A preliminary inquiry into the outbreak has been begun by an official from Dublin of the Free State Department of Local Government The source of the outbreak is declared to be local According to the *Irish Times* it is attributed to a patient who suffered from typhoid nine years ago and who, on examination, was found to be a carrier

SCOTLAND

The Edinburgh Chancellorship Lord Tweedsmuir's Candidature

Two persons have been nominated for the post of Chancellor of the University of Edinburgh, rendered vacant by the death of Sir James Barrie These are the Marquess of Lothian and Lord Tweedsmuir, now Governor-General of Canada and known throughout the English-speaking world for his writings as John Buchan At a meeting of the General Council of the University, held on November 26, Lord Tweedsmuir gained a large majority in a vote of members present A poll was, however, claimed, and voting papers will be issued immediately to all graduates on the printed register of the General Council resident in the United Kingdom These must be returned not later than December 17 During the proceedings reference was made to the fact that Lord Lothian is a Christian scientist, and to his views on animal experiments The election of Lord Tweedsmuir was moved by Dr Edwin Bramwell who reminded the Council that Lord Tweedsmuir was one of the outstanding Scotsmen of to day, 'one who had done much in the service of the nation, a distinguished scholar, a brilliant man of letters, a man of affairs with a wide administrative experience a man with a broad outlook whose judgement was universally acknowledged and compelled confidence, a man with influence, who was not only in complete sympathy with, but who took a keen interest in and was necessarily *au fait* with, the requirements of a University We feel so strongly about Lord Tweedsmuir as an ideal candidate for the post that we are well prepared to wait the two or three years until he retires from his present position" These quotations are from a full report of the meeting in the *Scotsman* of November 27

Rheumatism Clinic in Aberdeen

At the annual meeting on November 25 of the Aberdeen Branch of the Red Cross Society, the president, the Marchioness of Aberdeen and Temair, said that there was a movement to organize a centre for the treatment of rheumatic disease and for research into its causes, and a desire had been expressed that the Aberdeen district might lead the way in this matter in Scotland The executive committee of the Scottish Branch of the Red Cross Society, after consultation with Professor Davidson, had resolved to follow the example of the British Red Cross in England, which had established a rheumatism clinic in London that had proved a great success A grant of £500 had therefore been made for the support of the movement in Scotland It was proposed in Aberdeen to set up a treatment centre at the new baths, and also a lectureship on the subject at the University, which would lead to further research into the causes of the disease and methods for its prevention and alleviation

Royal Infirmary of Edinburgh

At the annual meeting on November 24 of the League of Subscribers to the Royal Infirmary of Edinburgh it was reported that the executive had considered the question of members of the League who were unable to get immediate treatment in the Royal Infirmary, and who entered a municipal hospital, being asked to pay the fixed charges for treatment It had been suggested that the Infirmary might pay the city for the treatment of members in municipal hospitals when they could not get admission to the Infirmary The executive had decided against this proposal It considered that there was no satisfactory compromise between the present open-door system with contributions freely given without obligation for treatment, and a contributory scheme under which payment would be made only to the hospital giving the treatment to the patient It was also stated at the meeting that in the past year 21,000 patients had been treated in the Royal Infirmary, of whom 9,482 were from the city of Edinburgh and 11,514 from the counties of Scotland and England Both expenditure and income had increased during the past year, although no provision had been made for capital expenditure which was going on steadily Mr Russell Paton, organizing secretary of the League, said that it might be assumed that a minimum contribution of twopence per week from all sections of wage-earners was essential for the maintenance of the hospitals on a voluntary basis, even when this was supplemented by auxiliary subscriptions, donations, and endowments

Departmental Committee on Nursing

The Committee recently appointed by the Secretary of State for Scotland to inquire into the recruitment and terms and conditions of service of nurses in Scotland has now held its first meeting under its new chairman, Lord Alness The meeting which was of a preliminary nature took into consideration the terms of reference, and decided on the procedure to be followed in carrying out the inquiry The next meeting is fixed for December 16, at which a start will be made with the taking of evidence The Committee is open to receive evidence on the subject of its inquiry from persons and bodies interested All communications should be addressed to the Secretary of the Committee Mr W T Mercer, Department of Health for Scotland, 121A, Princes Street, Edinburgh

Medical Notes in Parliament

In the House of Lords on November 30 the National Health Insurance (Juvenile Contributors and Young Persons) Bill, which has passed the House of Commons, was read the second time

The business of the House of Commons this week included the Committee stage of the Air Raid Precautions Bill, the second reading of the Unemployment Insurance Bill, and the second reading of the Local Authorities (Hours of Employment in Connexion with Hospitals and Institutions) Bill Opposition was expected against the last on the ground that an inquiry into the conditions of the nursing profession is in progress

In the House of Commons on November 30 Mr CHAPMAN introduced the Prevention and Treatment of Blindness (Scotland) Bill, which enables local authorities in Scotland to make arrangements for the prevention and treatment of blindness He said that there were 8,738 blind persons of all ages in Scotland The Bill would give local authorities the powers possessed by similar bodies in England and Wales These powers would be permissive

Clauses in the Unemployment Insurance Bill, which Mr Ernest Brown has introduced, enable education authorities for higher education in England and Wales and education authorities in Scotland to provide for unemployed juveniles attending junior instruction centres and classes (*a*) meals in the same circumstances and under the same conditions as meals may be provided by authorities for elementary education in England and Wales for children attending public elementary schools and by education authorities in Scotland for children under obligation to attend and attending school, (*b*) during the hours when instruction is being given, milk and biscuits free of charge The Bill further gives powers in respect of medical treatment of such juveniles to education authorities in Scotland The authorities in England and Wales already have corresponding powers Education authorities desiring to use the powers to be conferred by this Bill must submit proposals to the Minister, who may approve them if they are in accordance with a scheme which he will draw up with the consent of the Treasury An Exchequer grant (normally 75 per cent of the cost) will be made towards the expenses of the authorities

The Typhoid Outbreak at Croydon

Answering questions on the Croydon outbreak on November 25 Sir KINGSLEY WOOD said Mr Harold Murphy and the two assessors to the public inquiry into the cause of the outbreak were holding an informal meeting that day but the officers of the Croydon Corporation were occupied with urgent executive duties in dealing with the outbreak and a short time must elapse before the opening of the formal investigation All possible effective steps had been taken by the Corporation acting in collaboration with officers of the Ministry of Health to safeguard the purity of the water supply and the public need have no further fear of infection from that source He had no doubt that the public would be given opportunity of tendering relevant evidence at the inquiry

On November 30 the Minister of Health was asked whether he was aware that the inhabitants of Croydon were not warned immediately upon the outbreak of typhoid and advised to boil their water before use and if he would make inquiries why this precaution was not carried out. Mr BERNAYS replied that this would be investigated at the forthcoming inquiry It would be improper for the Minister of Health to anticipate the results of that inquiry

Malnutrition

Mr LEONARD in the House of Commons on November 24 moved a motion which asked the House to note the "convincing evidence of widespread malnutrition" and called for effective steps to deal with this grave and urgent problem of hunger and want." He cited what he termed 'the unchallenged evidence of Sir John Orr upon infant mortality," and said he doubted the sole right of the doctor to make judgements on these matters In the Hebburn district, a distressed area a new medical officer came in 1935 from a non distressed area He classified as subnormal and bad more than double the number that had been so classified by his predecessor

Mr GEORGE GRIFFITHS seconded the motion He said official figures showed that of children in the schools 26 per 1 000 required more and better food In Pontypridd the proportion was 210 per 1 000 In his own Division two boys who met with slight accidents when working in the pit were taken to Beckett s Hospital at Barnsley and died The doctor said those two boys went under not so much on account of the accident as on account of the state of their health

Mr HAMILTON KERR moved an amendment which asked the House to express satisfaction with the action taken and proposed to be taken to improve nutrition Sir ARNOLD WILSON seconded this amendment

Mr RIDLEY stated that the Derbyshire County Council did not provide one free solid meal for one child in the whole of that county The Board of Education had not done enough to persuade reluctant local authorities to use the provisions on the Statute Book for this purpose Lady ASTOR said a report from the Board of Education showed that local authorities had power first to discover the children and then to feed them freely where parents were unable to do it The Government ought to take powers to compel local authorities to do this When the Government tried an experiment of giving cheap milk in some distressed areas the children immediately drank four times and the mothers three times as much as before

Mr BERNAYS said that the Government was giving unremitting attention to the problem of making good the deficiency in the consumption of milk Nearly 3 000,000 children were receiving milk under the Board of Education scheme Under maternity and child welfare services ninety-eight authorities had increased the period during which milk was supplied sixty two had increased the quantity, and forty two had adopted a more liberal scale Of two diseases associated with malnutrition—tuberculosis and rickets—mortality from tuberculosis now numbered only half what it was twenty five years ago and mortality from rickets was half what it was five years ago

Mr JOHNSTONE said a lecture given to the Royal Statistical Society on November 16 by Mr R H Jones statistician to the University of Liverpool, revealed the different results of different doctors examining children and the different results of the same doctor examining the same children at intervals of a week or two Out of 100 children examined in Cheshire one doctor found three subnormal boys In the same 100 children another doctor found ninety subnormal boys

On a division Mr Leonard s motion was rejected by 202 votes to 140, and the alternative words proposed by Mr Kerr were not put to the House Discussion followed on another motion moved by Mr TINKER, which declared that present inequalities in the distribution of wealth could not guarantee the necessary standard of life to numbers of the population This motion was also rejected

Evacuation of Overcrowded Areas in Air Attack

When the Air Raid Precautions Bill was considered by the House of Commons in Committee on November 25, Dr HADEN GUEST moved to add that local authorities be made responsible for the evacuation of persons residing in overcrowded areas or in areas particularly liable to attack He said that in the opinion of the greatest bacteriologists there was no likelihood of bacterial warfare being undertaken Destruction of the water supply or of the sewerage of a city would suffice to bring on typhoid, dysentery and so on A panic evacuation would induce sanitary catastrophes or epidemics The evacuated population would have to be spread thinly over the relatively safe areas, with proper regard to water supplies and sanitation

Correspondence

Collaboration between General Practitioner and Public Health Services

SIR—With a view to improving the liaison between local public health authorities and doctors in private practice I suggest that the chairman and vice chairman of the local Division of the British Medical Association be *ex officio* members of the local council and public health committee

The practitioners concerned would then have the right to (1) attend the meetings of the council and public health committee (2) confer with the medical officer of health and conversely the M O H would have the right to confer with his medical colleagues (3) receive copies of reports of the medical officer of health

As you know the chairman of the local council is *ex officio* a magistrate during his tour of office, thus ensuring a desirable liaison between the local authority and those who administer the law As a general rule the busy practitioner has not the time to attend all the meetings of the local council, but when he does come forward for election I have noted that he frequently 'tops the poll —I am, etc,

H W GRATTAN
Colonel late R.A M C late M O H Biggleswade Urban and Rural Districts Welwyn and Hatfield Rural and Welwyn Urban Districts

Letchworth Nov 29

Immunization against Typhoid

SIR—In his letter to the *Journal* of November 27 Dr Vaughan Facey has raised the question of the negative phase and the danger arising therefrom said to occur after preventive inoculation against the typhoids when given during the course of the outbreak Among those of the profession old to the ways of typhoid a negative phase occurring after such inoculation has no terrors The doctrine of this negative phase must have prejudiced many against the use of prophylactic vaccine in the presence of an outbreak even in spite of much that has been said and written by clinicians against such happening In practice preventive inoculation given at such a time is in my belief the only sure and certain method of *individual* protection against the disease During the Bournemouth outbreak of last year none among many contacts inoculated developed the disease Immediately typhoid broke out inoculation was offered to the nursing staff of the Royal Victoria and West Hants Hospital Most of the nurses and maids elected to be done and it was noticeable that those nurses who volunteered to be done although careful as always had the greater confidence because less afraid of contagion appearing to have less fear in handling patients Was this greater confidence justifiable? I conscientiously believe that it was

Dr Vaughan Facey recommends trial of serum given early in full dose In this I agree with him although serum in my hands has given equivocal results To do any good serum must be administered early because by the very nature of the pathological processes in typhoid termination other than by lysis cannot be expected to happen after the first few days of raised temperature Perhaps time will bring a better more specific serum than is at present available But the very essence of success in the management of the typhoid patient lies in the regular cleansing of tongue and mouth the maintenance of the salt and water balance in the circulating body fluids which is as important as correct timed feedings constant expert nursing the recognition of the minor importance of drugs and the use, perhaps of small repeated intravenous doses of immunized blood Much however should not be expected of curative serum—I am, etc

Bournemouth Nov 28 S WATSON SMITH

SIR—I was extremely interested in Dr R Vaughan Facey's letter in the *Journal* of November 27 (p 1092) He writes of the doubts and anxieties which beset many of the members of the profession in Bournemouth last year I was equally worried when typhoid broke out in the Basque camp and without doubt many Croydon doctors feel the same to day Dr Facey went to great trouble in consulting leading experts in epidemiology and discovered that the consensus of opinion was in favour of inoculation and that the risk of a negative phase could be ignored A negative phase is said to follow an inoculation and may (1) either precipitate and intensify an attack of typhoid in a person actually incubating the disease or (2) for a few days so reduce the resistance of a healthy person that he may even more readily contract the disease The fear of inducing this negative phase has prevented many doctors from using typhoid vaccine in the presence of an epidemic

At the Basque camp we were under the unofficial supervision of the Ministry of Health and enjoyed the friendliest co operation with the public health authorities of Winchester and Southampton The Ministry of Health agreed that camp personnel engaged in sanitation and cooking should be inoculated but advised against mass inoculation of the children However when local committees anxious to receive the children knew that we had typhoid in the camp they asked that we should guarantee freedom from the disease before dispatching them and I then arranged general inoculation including all contacts This procedure was entirely successful and no further cases occurred (see *Journal* October 16) In the early stages sanitation was chaotic and field drainage and water supply were constantly interfered with by mischievous boys so that it seems impossible to explain the cessation of the epidemic in any other way than the result of inoculation The actual typhoid cases had been in close contact with many other persons in this crowded camp of 3 280 children and 300 adults and surely some other children must have been incubating the disease One asks therefore does this so-called negative phase really exist? This practical experiment on a large scale seems to suggest that it does not and that an effective immunity is established early after inoculation Furthermore treatment of enteric by vaccine is highly recommended by some eminent authorities Replying to Mr W Roberts in the House of Commons Sir Kingsley Wood Minister of Health stated that the circumstances of the outbreak of typhoid in the Basque children's camp at Eastleigh and that at Croydon were different and he was advised that general anti typhoid inoculation in Croydon would not be beneficial The protection by inoculation or otherwise of individuals resident in houses in which cases of typhoid were being nursed was a matter for consideration by the medical practitioner in attendance in the light of the special circumstances of each case

I would beg to point out that during any epidemic once the source of infection has been discovered and stopped

Sir SAMUEL HOARE said the Committee of Imperial Defence was engaged on problems of evacuation

The amendment was negatived by 226 to 125

Mr GEOFFREY LLOYD stated on November 25 that the recommendations of the Air Raid Precautions Department on the protection of a room against gas were based on experiments carried out over a period of years Research on this subject continued The building used for most of the tests was a brick built cottage in a reasonable state of repair Mr Lloyd also stated that the respirator which would be provided for the civil population would be manufactured in three sizes The details of the arrangements for fitting members of the public would be made by the local authorities The respirators should be fitted in time of peace

Problem of Population

On November 29 Sir KINGSLEY WOOD moved the second reading of the Population (Statistics) Bill, He said that much more information was required on the whole subject of the decline in the birth rate before policy could be considered Inquiries as to fertility in this country were not new and there was no ground for the suggestion that the answers given would not be treated with complete secrecy No questions about birth control would be put down Apart from considerations of more public importance it was a hasty and superficial view to put a question about birth control The answers would take them no further Contraceptive methods might be one of the means but was not the cause of the decline in the birth rate which they desired to ascertain

There was a question about the issue of an unmarried woman Approximately 30 000 illegitimate births took place in Great Britain annually It was only in the case of an unmarried woman that the question of illegitimacy was raised and he would have regard in committee to the general opinion of the House on that matter When the inquiry was in progress they would have regular annual figures showing area by area and for the country as a whole the number of children born to parents of particular ages and occupations with varying duration of the marriage The figures would be tabulated by areas and would show any local or occupational variations in fertility They would furnish valuable and essential information on which a further inquiry into the real operative causes could be thoroughly examined.

Mr PETHICK LAWRENCE moved an amendment to the effect that the House while recognizing that the collection of some additional facts regarding the population might be desirable, could not assent to the second reading of a Bill which instructed the registrars to elicit confidential and intimate information not urgently needed for statistical purposes

During the debate Sir FRANCIS FREMANTLE said that what was needed was to discover the real reason why people limited their families We did not know if there was some vital factor in modern civilization some involuntary unconscious factor that was undermining the fertility of people generally in either sex

The motion for the rejection was negatived by 197 votes to 125 and the Bill was read a second time

General Practitioners and Public Health Service

Commander FLETCHER asked on November 25 if the Minister of Health was aware of the lack of collaboration between doctors in private practice and the public health services and its possible bearing on recent epidemics at Bournemouth and Croydon and if he would set up a committee to investigate this subject Sir KINGSLEY WOOD answered that in so far as the question related to events connected with the outbreak of typhoid at Croydon he could not anticipate the results of the inquiry Every opportunity was taken by his Department to emphasize the need for collaboration between the various branches of the medical profession He was glad to say that there was increasing recognition of this need on the part of local authorities

Watercress and Typhoid

On November 29 Mr DONNER asked the Minister of Health whether he was aware of the serious plight of growers of watercress in North West Hampshire and elsewhere from the refusal of retailers to buy in consequence of public fear of typhoid infection and whether he could give an assurance that there was no evidence to show that watercress was responsible for the present outbreak and that the public incurred no danger by eating watercress particularly when grown as in Hampshire a great distance from any known centre of infection Mr BERNAYS replied that the attention of the Minister had been drawn to Press statements on this matter While he could not properly express an opinion on the cause of the present outbreak pending the result of the forthcoming public inquiry the Minister had no evidence to suggest that it was in any way connected with the eating of watercress

Anti typhoid Inoculation

Mr WILFRID ROBERTS asked on November 25, whether in view of the successful suppression of an outbreak of typhoid at the Basque children's camp at Eastleigh in the summer by inoculation it was proposed to recommend inoculation as a preventive measure in the Croydon area Sir KINGSLEY WOOD replied that the circumstances of the two outbreaks were different and general anti typhoid inoculation in Croydon would not be beneficial The protection by inoculation or otherwise of individuals resident in houses in which cases of typhoid were being nursed was a matter for consideration by the medical practitioner in attendance in the light of the special circumstances of each case

Northumberland County Council and Anatomy Acts—Mr BERNAYS replying to Mr. Thorne on November 23, said that a request was made to the Northumberland County Council by the Inspector of Anatomy with the Minister of Health's authority that in the interests of medical education they should in exercise of their powers under the Anatomy Acts 1832 and 1871 permit the anatomical examination in the School of Medicine of the University of Durham at Newcastle upon Tyne of the bodies prior to interment of any persons under their charge who died without being claimed by relatives for immediate burial Arrangements of this kind were in operation in many areas but the matter lay within the discretion of the local authority The Northumberland County Council had after consideration decided not to exercise their powers in the manner suggested

Harefield Sanatorium—On November 23 Mr HORE BELISHA replying to Mr Messer said that the Harefield Sanatorium was visited by a medical staff officer of the Eastern Command on December 9 1936 Prior appointment for the visit was made with the superintendent of the sanatorium The purpose of the visit was to ascertain whether it was any use approaching the Middlesex County Council to earmark the sanatorium as one of the twenty nine Territorial Army General Hospitals required on mobilization The sanatorium was again visited at the beginning of last May by the Deputy Director of Medical Services Eastern Command after making prior appointment in writing with the superintendent to verify its suitability for the purpose in question

Deaf and Dumb and State Benefits—Mr BERNAYS replying to Mr Pilkington on November 23 said that the number of deaf and dumb persons in the United Kingdom had been estimated at about 40 000 but no accurate figures were available. The question of putting them on the same footing as the blind in regard to State benefits had been considered but for the reasons contained in the exhaustive report of the late Dr Eichholz published in 1932 the Minister of Health was not satisfied of the necessity for the legislation which would be required to give effect to this

Imported Butter Detection of Tuberculous Infection—Mr LAMBERT asked on November 25 whether imported butter made from the milk of tuberculous or diseased cows abroad could be detected by analysis at the ports of entry into Great

then the problem is the same as that of the Basque camp—that is, dissemination by contact—also that it is not always easy to locate a source of infection, which may be multiple Public opinion is very divided on the question of inoculations of any kind, and in these days it is not often that a large-scale preventive inoculation could be carried out under a medical dictatorship such as actually existed in this refugee camp In war time sewerage and water systems may be damaged daily, to the great danger of the uninoculated public at large It would not be untoward to suggest that a stock of T A B vaccine should be included in our air raid precautions armamentarium All available civil supplies were exhausted with the first inoculations at the Basque camp, and the Lister Institute kindly worked overtime to supply enough for the second dose—I am, etc,

London N W.2, Nov 27 RICHARD TAYLOR M B, B S

SIR,—I have recently been consulted by several of my patients as to what precautions they should take against typhoid Apart from the usual advice of keeping away from contacts, observing sanitary precautions, boiling milk and water, and not eating raw vegetables, I prescribed an oral anti-typhoid-paratyphoid vaccine (T A B) in the form sometimes known as Besredka's tablets Professor Besredka published his original papers on oral vaccination about twenty years ago His method of immunization has not become popular in the United Kingdom mainly owing to the low incidence of this disease here as compared with tropical and subtropical countries Actually, millions of people have been immunized by this method during epidemics of typhoid, dysentery, and cholera in Europe, America, India, and Africa The Health Department for Capetown distribute these tablets free of charge to doctors, and I have given them to my patients and taken them myself every year while in practice in South Africa The only symptoms they give rise to are slight headache, gastro intestinal discomfort, and possibly a slight rise of temperature Thousands of prophylactic doses of oral vaccine were distributed from 1923 to 1928 in Pretoria alone (Boyd)

Investigations conducted in Madras showed that the proportion attacked among persons given the full course of bilivaccine (three doses) was 1 per cent, compared with 6 per cent in the untreated controls Among 33,000 vaccinated persons in Tokyo there was a morbidity rate of 1 86 per 1,000, whereas among 46 000 non-vaccinated persons the rate was 8 5 per 1,000 The advantages of this method are (1) its efficacy is said to be equal to that of the injection method, (2) immunity is established within five days, and (3) large numbers of people, including children, can therefore be immunized (orally) rapidly, with little discomfort and pain, and at a very small cost to the administration Cluver (Union of South Africa) states that his patients, particularly the natives, were more willing to be vaccinated, and no malaise followed the ingestion of the antigens, whereas unpleasant reactions were often observed after subcutaneous vaccination

I firmly believe that this method of oral vaccination materially reduces the incidence of the disease when used in conjunction with the usual measures in sanitation and personal hygiene, and that where typhoid fever is epidemic or threatened Besredka's tablets should be distributed by the health authorities free of charge, to doctors for their patients Finally may I add that doctors throughout the country should be acquainted with this method of immunization It is not mentioned in several of the leading textbooks, but is referred to in Conybeare's *Text-book of Medicine*—I am, etc,

London, S W 4 Nov 29 J V PINCUS

*** In a leading article in the *Journal* of April 10, in which reference was made to the oral vaccine of Besredka, to formolized vaccine and to a vaccine which can be "rubbed into the skin in an ointment or vanishing cream," we stated 'The probability is that all these methods are useful, and it may be that where ordinary subcutaneous vaccination most signally fails either the individuals attacked were exposed to exceptionally heavy infection or the strains used in making the vaccine were unsuitable"—ED *B.M.J*

Safe Watercress

SIR,—Watercress has been much written about lately, and it is as well to know that it can be grown directly from seeds in small tanks or tubs, or openly in a sheltered place in our gardens Those who fear its contamination from water supplies not easily controlled when heavy rains suddenly wash undesirable organic matter into an otherwise perfectly pure water supply will be interested in the article on watercress, page 66, in the *Popular Encyclopaedia of Gardening* edited by H H Thomas, published by Amalgamated Press Ltd

Most of the watercress consumed by the public is now grown under perfectly safe conditions by firms who have spent much capital and great care in safeguarding this popular article of diet The real risk arises from the purchase of cheap watercress whose source is the stagnant pools and contaminated streams in urban areas—I am, etc,

Bournemouth, Nov 29 W JOHNSON SMYTH

Management of Typhoid Fever

SIR,—In 1936 there were 257 deaths from typhoid and paratyphoid fever in England and Wales—equivalent to a fatality of 10 3 per cent among the notified cases—and a repetition of somewhat extensive outbreaks in the last few years has drawn attention to the fact that these diseases are far from being extinct in this country A description of an experience of the management of typhoid fever about thirty years ago might be of interest, although few detailed statistics can be given, for the case papers were destroyed during the war

In the three years I was in charge of the typhoid wards of one of the hospitals of the late Metropolitan Asylums Board some 2 139 cases were treated in the Board's hospitals, with a mortality of 14 4 per cent among those in whom the diagnosis was confirmed In practically a quarter of the fatal cases perforation was the immediate cause of death, while haemorrhage which occurred in 11 per cent of all cases accounted for the fatal issue in nearly a quarter of the remainder Perforation and haemorrhage were thus formidable complications and I tried a number of variations on the usual management with a view to reducing their incidence It was unlikely that any modification of the then routine would have an appreciable effect on cases admitted in an advanced stage, and these unfortunately were relatively numerous but it was hoped that better results might be obtained in cases admitted earlier in the course of the disease

The mechanism of perforation is better studied on the operating table than in the post mortem room where the original state is apt to be hopelessly obscured by peritonitis I had been present as operator or assistant at twenty four laparotomies for perforation and had observed that these cases could be divided into two groups (1) Those in which the visceral peritoneum over an ulcer had become adherent to

Britain Sir KINGSLEY WOOD replied that it could if the milk had not been pasteurized and, in the case of tuberculosis if the cows actually yielded milk containing tubercle bacilli Practically all milk and cream used for making imported butter was pasteurized

School Dental Service—The present staff of the school dental service in England and Wales is equivalent to about 735 full time dentists On the assumption that the ratio of the number of children receiving dental treatment to the number recommended for such treatment remained as at present, a staff equivalent to about 1,100 full-time dentists would be required to provide for all children attending public elementary schools a service of the type now available Mr KENNETH LINDSAY, in giving this information, added that the percentage of parents who accepted dental treatment for their children was regrettably low, and efforts were being made to increase it If appreciation of the facilities provided, and particularly of the opportunities for conservative dental treatment were universal, an efficient service for all public elementary school children would necessitate the employment of slightly more than 2,000 full time dentists, or their equivalent in terms of part time service

Notes in Brief

About three million respirators have been placed in the regional depot in Liverpool

The number of notified cases of acute poliomyelitis and acute polio-encephalitis in England and Wales during the current year up to October 30 is approximately 705, as compared with an annual average of 698 for the last five years

A second anti gas school will open at Easingwold, near York, on December 27 The school at Falfield Gloucestershire, accommodates sixty students and on completion the Easingwold school will accommodate a similar number

Sir Samuel Hoare will consider a suggestion that he should draw the attention of the General Medical Council and similar bodies to the need for increased vigilance in the custody of poisons and drugs by medical practitioners and chemists Sir Samuel hopes, however, that the publicity given by broadcast warnings and otherwise will suffice to ensure the utmost care

A further experimental scheme for the supply of milk at cheap rates to expectant and nursing mothers and children under 5 years of age came into operation on October 1, at Whitehaven

Measures recommended to safeguard the inmates of mental hospitals against the effects of poison gas following an air raid will be those recommended for the civilian population as a whole, with such special arrangements as the condition of the patients may require Specially trained medical instructors will be available for lectures and practical demonstrations to the medical and nursing staffs

The estimated cost of providing free milk to all children under school age and to expectant mothers daily in England and Wales is about £18,000,000 per annum.

The Services

ARMY MEDICAL SERVICES

The War Office announces that Colonel W B Purdon, D S O, O B E. M C, late R.A.M C, Professor of Hygiene, Royal Army Medical College, has been selected for promotion to the rank of Major-General, and for the appointment of Commandant and Director of Studies Royal Army Medical College from March 1, 1938 in succession to Major General W P MacArthur, D S O O.B E, late R.A M C. who assumes the appointment of Director General Army Medical Services, on that date Colonel Purdon will be succeeded as Professor of Hygiene Royal Army Medical College by Lieut-Colonel D T Richardson M C R.A.M C., who at present holds the appointment of Assistant Director of Hygiene the War Office

DEATHS IN THE SERVICES

Deputy Inspector-General CHARLES WILLIAM SHARPLES R N (ret), died at Bognor on October 28 He was educated at the Middlesex Hospital, and took the L S.A. in 1878 and the L R C S Ed in 1881 after which he entered the Navy He attained the rank of Fleet Surgeon on August 25 1897, and retired as Deputy Inspector General on February 27, 1909

Lieut Colonel JAMES HENRY CURTIS R A.M C (ret.) died on September 27, aged 77 He was born at Cork on April 30 1860, educated at Queen s College, Cork and qualified L R C P and S Ed in 1883 He entered the Army as surgeon on May 30, 1885 became lieutenant-colonel after twenty years service, and retired on June 4 1910 He served in the South African war of 1899-1902, and took part in the relief of Ladysmith and was present at the actions of Colenso, Spion Kop, Vaal Krautz Tugela Heights, and Picker s Hill. Afterwards he served in operations in the Orange Free State the Transvaal, Natal, and Cape Colony He received the Queen s Medal with a clasp and the King s Medal with two clasps He rejoined on August 5, 1914, for service in the war of 1914-18

Medical News

A sessional meeting of the Royal Sanitary Institute will be held at 90, Buckingham Palace Road, S W, on Thurs day, December 9, at 4.30 p.m., when there will be a discussion on 'Public Health and the Factories Act, 1937,' to be opened by Dr A Massey and Mr Maurice Malins The chair will be taken by Sir Francis Fremantle, M.P, M D The Institute will also hold a sessional meeting at Oxford Town Hall on Friday, December 10, at 5 p m, when papers will be read by Dr F G Hobson on "What is Scarlet Fever?" and by Mr Stewart Swift on "Over crowding Standards A Comparative Study' On December 11 visits will be made to the Nuffield Institute for Clinical Research and the Oxford Corporation Waterworks

Sir Joseph Barcroft, F R S., will give an address on "Foetal Respiration" before the Listerian Society of King s College Hospital Medical School at the school, Denmark Hill, S.E, on Wednesday, December 8

A meeting of the Paddington Medical Society will be held at Paddington Tuberculosis Dispensary, Talbot Road, W, on Tuesday, December 14, at 9 p.m, when Dr H. L Marriott will give an address on "The Treatment of Cases of Acute Poisoning" Non-members are invited to attend and to take part in the discussion

A winter sports tour designed to interest medical students has been arranged for this Christmas by the National Union of Students in co-operation with the medical office of the International Confederation of Students and the director of the Swiss University Sanatorium It will provide opportunity to combine study of the leading Swiss sanatoria as the guests of the sanatorium authorities with a week at a winter sports centre in the Matterhorn district The party will leave England on December 27 and return on January 8 Particulars may be had from the National Union of Students, 3, Endsleigh Street, London, W C 1

On November 25 Lord Sankey accepted, on behalf of University College, London, a portrait bust in bronze of the late Henry Tonks, F R C S, who was Slade Professor of Fine Art in the University of London from 1917 to 1930 The bust is the work of Horace Gerrard, a former pupil and colleague of Tonks Wood engravings of Bath and its neighbourhood by Mr Gerrard adorned the *Book of Bath* which was presented to all members of the British Medical Association taking part in the Annual Meeting there in 1925 An inscribed tablet on Professor Tonks s house in the Vale, Chelsea and the founding of an annual prize for drawing in the Slade School complete the memorial.

something more fixed than itself so that peristalsis had produced a tearing through of part of the ulcer In one patient an ulcer adherent to the pubes had been partially torn across in another an ulcer adherent to an appendix epiploica had given way just beyond the adhesion in a third case the torn ulcer had been in part firmly glued to the peritoneum over the psoas muscle in yet another the tip of a Meckel s diverticulum adherent to the abdominal wall had been torn off In these cases the tear was larger than in the second group and faecal matter sometimes in considerable amount had escaped into the peritoneal cavity with a uniformly fatal result (2) Those in which the sloughing had extended up to the peritoneal coat and this had given way the usually minute opening allowing the escape of gas and perhaps a little fluid before being blocked by the slough or bowel contents In these cases too it seemed likely that peristalsis had acted as the immediate cause either by attempting to move a slough which had not quite separated or by increasing the tension in a part of the bowel weakened not only by ulceration but by distension The onset of symptoms in many of the cases confirmed the idea that the perforation had been associated with a more or less vigorous peristalsis since often it bore some relation to the giving of an enema or the patient had just passed a stool or what was equally suggestive had felt inclined to do so

It seemed likely that haemorrhage also was largely due to distension and peristalsis the former leading to a thinning of the bowel wall and the latter to premature separation of the slough The indication therefore was to reduce both to a minimum by the local application of cold assisted if necessary by intestinal sedatives removing at the same time the need for peristalsis by giving a diet which while sufficient to maintain the strength of the patient during this long illness gave a minimal residue Cold was applied continuously to the abdomen by means of a large coil of flexible aluminium tubing the terminals of which had attached to each a length of rubber tubing weighted at the end This had the advantage of being light and could be adjusted closely to the abdomen by means of a bandage tied round the waist the patient was thus enabled to lie on his side and so assist in the prevention of bedsores and hypostatic pneumonia Water was slowly siphoned from a toilet jug placed on a locker to a jug standing on the floor the siphon action being started with a ball syringe when the first jug was nearly empty the rubber tube was pinched and the jugs interchanged In hot weather or when the patient s temperature was high ice was added to the water The daily diet consisted of 2½ to 3 pints of whey with 6 to 8 teaspoonfuls of plasmon and the same quantity of lactose 4 to 5 oz. being given two-hourly The mixture was pasteurized in bulk and the feeders boiled A teaspoonful of lemon juice orange juice or raw meat juice was administered at intervals The fact that the plasmon did not entirely dissolve in the whey disturbed some patients other preparations now available are free from this objection and doubtless the dietary could now be improved in other respects An enema was given about twenty four hours after the diet had been started in order to evacuate thoroughly the lower bowel and thus start with an intestine as free from solid contents as possible Afterwards every effort was made to prevent the bowels being opened a starch and opium enema being given after each stool if this was not effective opium in some form was administered by mouth In the fourth or fifth week of constipation usually not before the patient complained of uneasiness in the rectum and a single enema was given to empty it

The results were more or less as had been anticipated As a rule in the moderately early cases no great difficulty was experienced in preventing action of the bowels the abdomen did not become distended and the general nutrition remained better than had been customary before this routine was instituted Contrary to the belief then prevailing no evidence was found that the action of the bowels was of service in limiting toxaemia indeed the reverse appeared to be the case and more than one patient s bowels remained unopened for five weeks without ill effect No instance of perforation or haemorrhage occurred among those whose bowels were brought under control The treatment probably made little difference on the other hand to those who had been admitted in the later stages of the disease and in whom it was often found impossible to arrest the diarrhoea all the fatalities occurred among these cases It was interesting to find however that although some of the latter had only been on the special diet for a few days at necropsy the lumen of the bowel was found to be markedly diminished as compared with cases treated in the usual way and its walls to be thickened and strengthened thereby Further the routine had the advantage that it very considerably reduced the work of the nurses, and incidentally the risk of their acquiring the disease

It is only right to conclude by remarking that in consequence of my transfer to another branch of the service I was able to apply the method during one season only I have heard from friends however that it has given satisfaction in a number of small outbreaks in this country and also in a more extensive one which occurred among the employees of an African mine where the nursing of enteric cases would otherwise have been extremely difficult under the primitive conditions prevailing—I am, etc,

W T GORDON PUGH M.D., F.R.C.S,

Bournemouth Nov 29

Atelectasis and Bronchiectasis

SIR—Dr G H Jennings s interesting article (*Journal* November 13 p 963) on re expansion of the atelectatic lower lobe and the disappearance of bronchiectasis again calls attention to the important question of acute atelectasis and/or massive collapse a phenomenon concerning the aetiology of which we are learning a great deal and a condition which we realize may in some cases be cured by very simple measures Dr James Maxwell in the current number of *St Bartholomew s Hospital Reports* (1937, **70**, 183), has described three cases which were under the care of himself and Dr E R Cullinan and Dr Geoffrey Evans In one the lung re-expanded completely after bronchoscopy in another after attempting to give lipiodol which made the patient cough violently, so displacing the obstructing plug in the third after breathing exercises

It is however on the second part of the title 'the disappearance of bronchiectasis that I would venture a word of criticism In atelectasis the bronchi as Dr Jennings says are crowded together but they are also very much shortened When an elastic tube is made shorter by contraction or otherwise it must widen or become distorted and this to my mind is what the radiograph taken after the injection of lipiodol in the article shows Etymologically the author could justify the use of the word bronchiectasis as meaning merely dilatation of bronchi but this inevitable and transient dilatation is surely not what we mean anatomically by bronchiectasis There has been so much theoretical nonsense talked and written about the mechanism of the production of bronchiectasis that I think we cannot be too careful in our nomenclature and description If the implication is that this transient condition is potentially bronchiectatic one must regard it as mere hypothesis I admit the high negative pressure in the pleural cavity in these cases but I doubt if mere retraction produced enlargement of calibre without an infective process produces bronchiectasis It is this fact if such it be that may explain the contradictory observations quoted in the article

There are doubtless different types of bronchiectasis but they are not to be classified by the pattern which to my mind is as irrational and useless as classifying flowers by their colours The subdivision into obstructive and

Up to the time of going to press the number of known or suspected cases of typhoid fever at Croydon was 248, with 10 deaths

The annual dinner of the Old Epsomian Club will be held at the Café Royal Regent Street, London, on Thursday, December 9, at 7 for 7 30 p m

At the Swedish Church Harcourt Street, London, W, on November 24, Dr A Kellgren Cyriax, physician in charge of the mechano-therapeutic department of the Elizabeth Garrett Anderson Hospital, unveiled a bronze plaque to commemorate the hundredth anniversary of the birth of her father, Henrik Kellgren, a pioneer in medical gymnastics who came to London from Sweden in 1875

The object of the Children s Minimum Council, whose president is Sir Frederick Gowland Hopkins, is to ensure that no child shall, by reason of the poverty of its parents, be deprived of at least a minimum of food and other requirements necessary for full health' Steps taken by the council to extend its activities outside London include a conference on child nutrition to be held at University College, Cardiff, to-day Saturday, December 4 This is the first of a series of similar conferences in various localities with the object of arousing public interest and uniting all local organizations and individuals concerned with maternity and child welfare Resolutions calling upon the Government to put nutrition in the forefront of the physical fitness campaign, and putting forward specific proposals for implementing this by means of increased unemployment allowances free milk for all school children and free dinners for necessitous ones cheap milk for mothers and young children and asking that the major cost of such measures should be borne by the national Exchequer, will be moved

The Board of Registration of Medical Auxiliaries, the body responsible for the *National Register of Medical Auxiliary Services* proposes to issue a distinctive badge to be worn by registered medical auxiliaries and it has been decided to institute a competition and to offer a prize of five guineas to the person who submits the best design for such a badge The competition is open to any person Entry to the competition is free, and persons desiring to compete should apply in the first instance, to the Registrar Board of Registration of Medical Auxiliaries British Medical Association House, Tavistock Square, W C 1 when details of the competition will be sent

The October issue of the *Annals of Surgery* is devoted to the transactions of the American Surgical Association for 1937 followed by a memoir of Sir Alfred Keogh by Major General Sir Michael Russell

The issue of the *Archives de Médecine des Enfants* for November is devoted to diphtheria

The new building of London House in Bloomsbury, a hall of residence for British men students from all parts of the Empire is being opened to day (Friday December 3) by Queen Mary The new buildings designed by Sir Herbert Baker R.A occupy a third of a freehold island site of about 1¼ acres fronting Mecklenburgh Square Caroline Place Guilford Street and Doughty Street When rebuilding is completed on the site there will be accommodation for 250 men

Sir James Crichton Browne M D F R S celebrated his ninety seventh birthday on November 29

The Academic Senate of the University of Leyden on October 29 celebrated the 300th anniversary of the introduction of clinical instruction

Dr Ferdinand Sauerbruch professor of surgery at Berlin has been elected a member of the physical and mathematical section of the Prussian Academy of Sciences

According to recent statistics there were 14 000 more deaths than births in Vienna in 1936 and throughout the Austrian Republic there was a deficit of four births per 1 000 deaths

QUERIES AND ANSWERS

Rapid Method of Examining Urethral Discharge for Gonococci

Dr B R SANDIFORD (Cairo) writes With reference to Dr F G Morgan s query on this subject (*Journal* November 6 p 947) may I bring to his notice an improved method of staining which I recently published in the *Journal of Pathology and Bacteriology* 1937 45 467? The film is treated as in Gram s method up to the end point of decolorization Then instead of a red counter-stain, Unna-Pappenheim stain is left on for two minutes and then quickly washed off Gram positive and Gram negative organisms will be stained purple and pink respectively the cell nuclei however will be bluish instead of pink The Gram negative organisms are thus more easily detected than when the nuclei are also pink. The Unna-Pappenheim stain is made up of methyl green 0 15 gramme pyronin 0.5 gramme alcohol (95 per cent) 5 c cm glycerol 20 c cm and carbolic acid in water (2 per cent) up to 100 c cm. It seems to keep quite well

Persistent Uterine Discharge

M R C S ENG would be grateful for suggestions as to whether hormone therapy would be useful in the following case Nullipara aged 35 years fifteen years intermittent uterine discharge watery in character and brownish in colour lasting for seven to ten days before menstruation which is of regular twenty-eight-days type loss moderately severe for seven to eight days During attacks she is irritable and depressed and has intense pruritus Physical examination negative She is under-sexed and of allergic type being sensitive to certain foods and foreign proteins Curettage has relieved the spasmodic dysmenorrhoea from which she suffered in her early sexual life but has had no effect on the discharge which is sometimes absent for a few months but invariably returns There is no leucorrhoea General health good

Camphorated Oil for Intravenous Injections

Dr VICTOR DE RUETTE (Wépion lez Namur Belgium) writes I would like to use camphorated oil intravenously in cases of pulmonary tuberculosis with cardiac failure Such a method is referred to in French medical papers as being used in general practice I should be grateful to hear from my colleagues who might happen to have experience in the matter if they consider this practice to be without danger in such special cases also to have their suggestions as to the quantity to be injected at a time the interval between the injections and the rate of injection

Income Tax

Liability to Surtax

SUPER has been charged to surtax on the basis that the amount of income liable is calculated by adding the earnings

non-obstructive serves a useful clinical purpose, but again is probably not a natural classification It would seem probable that in every case, except in the congenital variety, an infective process is at work with destruction of the bronchial wall, and the question of the re-epithelialization of the resulting space in some cases cannot, I believe, be altogether dismissed We have had the coughing theory of bronchiectasis, the inspiratory theory, the expiratory theory, the weight of retained secretions theory, the specific infection theory, the pleural adhesion theory, and the fibrosis theory, all probably false, and now comes the high negative pressure and atelectasis theory, which probably has a great deal more of substance in it as an explanation of the occurrence of a proportion of cases, but we must proceed carefully, and especially so when we speak of the disappearance of bronchiectasis —I am, etc,

F G CHANDLER M.D, F.R.C.P

London N W 1, Nov 23

Disseminated Focal Pneumonia

SIR —After reading the comments by Dr L G Higgins (*Journal* November 20, p 1045) on the article by Dr J G Scadding (November 13, p 956) I feel I must express my regret at two of his remarks

First, 'the sputum, examined at the request of anxious relatives, shows no unusual organisms" So long as sputum is only examined for tubercle bacilli at the request of relatives, so long will many open cases of pulmonary tuberculosis be missed, or the diagnosis delayed Examination of sputum is second only in importance to the history and the symptoms of the patient Abnormal physical signs in the chest, which are notoriously misleading should take third place in importance Secondly, "I have never suggested an x-ray examination of the chest, partly because the resulting pictures would certainly frighten everybody" I can only think that Dr Higgins has had the misfortune in the past of being "let down' by his chest films—that is through their being technically faulty, or faultily interpreted Good serial films properly interpreted are again essential if doubtful or chronic chest cases are to be scientifically investigated and if tuberculosis is to be finally excluded —I am, etc,

Winsley Sanatorium, Bath, Nov 21 A. J P ALEXANDER.

Contact Lenses

SIR —The question of contact lenses has aroused considerable interest since the presentation of Dr Dallos's paper on the subject at the Oxford Ophthalmological Congress That correcting lenses worn in contact with the cornea offer, in theory the best means of correction has long been recognized, but the practical difficulties of making a glass which is optically perfect and at the same time wearable for long periods have been usually looked upon as almost insuperable As long ago as 1887 Muller succeeded in demonstrating that it was certainly possible to make such a glass but the technical difficulties remained great With the introduction of ground contact lenses fresh interest in the subject was aroused, and a certain number of patients benefited The disadvantages of the original ground contact lenses may be summed up by saying that since they all have a scleral portion ground to a spherical curve they are unsuitable for use in cases of scleral astigmatism (which are commoner than was formerly thought) and that as they exist only in a relatively small range of sizes it is not always, or indeed often, possible to find one which can be tolerated

Various attempts to overcome these difficulties have been made in recent years, and the most successful as well as the most scientific certainly appears to be that advocated and perfected by Dr Josef Dallos of Budapest In his method of fitting, a mould or cast of the anterior segment of the eye is first made and the glass then formed accurately to this The final fitting (which includes removal of pressure on the cornea and limbus region where close contact cannot be borne) is done by grinding away the glass by hand, with frequent controlling on the patient, until a perfectly even and light pressure is obtained Such glasses can be worn for long periods without discomfort or harm to the eye, and are of inestimable benefit in cases of conical cornea, irregular corneal astigmatism, aphakia, and high errors of refraction generally They give a retinal image of normal size, and an increased visual acuity over that obtainable by spectacle lenses in such cases, as well as a full field of vision Their use is greatest in cases in which full visual acuity cannot be obtained with spectacles, but they are also indicated for occupational reasons—for example, for stage and film work and in patients exposed to rain and steam where glasses would be likely to fog

Such contact lenses manufactured by the method and under the supervision of Dr Dallos are now obtainable in this country, and a centre is in existence in London to which patients can be referred for the processes of fitting Courses of instruction in the technique are also to be held, and a section dealing with hospital cases has been inaugurated The results obtained so far seem to justify a wider recognition of the value of Dr Dallos's work in this direction —We are, etc,

Medical School W C 1 Nov 29 THOMAS LEWIS

Antuitrin S Intradermal Pregnancy Test

SIR —I read with interest the article in the *Journal* of November 27 (p 1069) by Dr A Morton Gill and Mr John Howkins on their investigations into the antuitrin S intradermal test for pregnancy About a year ago a colleague, Dr W S Haynes, and myself, working at the General Lying in Hospital, York Road, investigated this test on a series of pregnant and non pregnant women Our conclusions were exactly the same as those of Dr Gill and Mr Howkins, and so hopelessly inaccurate were the results that, after applying the test to about twenty-five cases we abandoned it We also investigated the possibilities of using the bitterling fish for a pregnancy test These small fish when the urine of pregnant women is added to their water become red about the belly in the case of the males and produce an ovipositor in the case of the females We had great success until we

shown in his 1936–7 return to the dividends, etc, of himself and his wife shown in the 1937–8 return. Is that correct?

*** Yes The basis on which surtax is chargeable is laid down in Section 38 of the Finance Act, 1927 and in effect is the income of the actual year of assessment. The assessment referred to by "Super" is for the financial year 1936–7, and as the ordinary income tax is assessed on the basis of the previous year's earnings the amount he entered in his income tax declaration for 1937–8 would be the statutory income of the year 1936–7 The personal allowance, whether for a single or a married man applies only to "standard rate" tax and not to surtax.

LETTERS, NOTES, ETC.

Need for an X-Ray Museum

Dr J H DOUGLAS WEBSTER (London W 1) writes Though radiology in Britain has not been developed to the same extent as in Germany and the United States—for a number of reasons which it is unnecessary to detail here—it is very far from being in a state of inertia as Mr A P Bertwistle says (*Journal* November 20 p 1054) The British Institute of Radiology is in an active and flourishing condition as its annual congress in December will demonstrate, the new Section of Radiology of the Royal Society of Medicine has one of the highest average attendances of any of the twenty-three sections at its meetings, the new British Association of Radiologists is an active organization which is proceeding to hold examinations for a higher qualification in radiology than is represented by the diploma, and the new Society of Radiotherapists holds frequent and well attended meetings at which the many aspects of *x*-ray and radium therapy are discussed In every direction there are indeed such evidences of active and progressive vitality that his strictures seem singularly ill timed There is something, however, to be said for his suggestion of a central x-ray museum Most large hospitals have their own local museum collections in radiology as in other subjects A large central museum would correspond to the surgical museum of the Royal College of Surgeons, but years would be needed for such a collection to be formed Special endowment of some existing body such as the British Institute of Radiology or the British Association of Radiologists would attain in time such an end, which needs space, money, and an active enthusiastic, and gifted curator—conditions not easily fulfilled. It would be a great help in teaching the subject to have under one roof a museum representative of radiology in all its aspects historical, technical, and normal varieties with typical illustrations, clinical pathological and radiological of the various diagnostic and therapeutic uses of radiology Not only an *x* ray museum but an x ray and radium museum should be aimed at for the subject to be illustrated in all its bearings on medicine and industry

Strangulation of a Herniated Ovary

Dr C EDWARDS (Bournemouth) writes The note by Dr M H. Fridjohn and Mr Maurice Lee (*Journal* August 7, p 265) on a strangulated ovary in a hernia occurring in a child aged 3 months prompts me to record the case of another female child of the same age who was admitted by Dr R S Weir (my partner and now of Dunfermline) to the Andover Hospital on August 18 1924 At his request I operated on her and found a right strangulated ovarian hernia She was discharged on August 20 1924 since she was being breast-fed Beyond the fact of age there appears to be nothing unusual in these cases except the scarcity of recorded instances in the literature The late Dr A. E Farr of Andover told me at the time of another case of about the same age which was operated on by an assistant of his in the belief that it was a suppurating gland in the groin

Spontaneous Cures of Cancer?

Professor A GALBRAITH FAULDS (Glasgow) writes In the issue of the *Journal* for November 20 we have been entertained to all the gruesome horrors of cancer with its relentless toll of victims the certainty of gastric troubles leading to malignancy and of uterine mammary hepatic, and corpora striatal disease turning out to be cancerous May I ask if there is no hope that these awful conditions have on the obverse strange courses which not only defy the ken of man but demonstrate the hidden methods of Nature in favour of the patients? Are there no surgeons like myself who have advised certain kinds of patients at or over 70, to leave a malignant breast with enlarged glands refusing to operate and who have seen the whole thing dry up and disappear? Are there no pathologists who can come forward and claim to have found at necropsy such evidence of obsolete cancer and obsolete tubercle as I have seen myself? No physicians who have seen malignant osteo sarcomas, which started at the body of the sphenoid, grew forwards pushing one eye out, and had to be extirpated, disappear like magic or chronic dyspepsias of over twenty or thirty years standing clear up under such simple treatment as fresh taraxacum without becoming malignant? All experienced physicians will corroborate this There are endless lists of such cases that can be quoted to prove that Nature can achieve even in malignancy remedies that stagger and humiliate the efforts of our great profession

Heavy Twins

Dr G GRIMSON (Finchley) writes A patient of mine recently gave birth to live full term twins each weighing 9¼ lb I would be interested to know if their weights are a record It was her third pregnancy, and the labour lasted seven hours the interval between the births being twenty minutes The first twin was a breech presentation and the second a vertex.

Medical Register Office Edition

The Registrar of the General Medical Council informs us that orders for the office edition of the *Medical Register* 1938 published by the Council at the special price of 10s a copy post free must be received, with a remittance at the office of the Council not later than December 31 1937 The office edition differs from the ordinary edition to the extent that it does not contain reprints of the Medical and Dentists Acts and other preliminary matter and is printed on less expensive paper and bound in boards It includes however the same entries relating to registered medical practitioners as are included in the ordinary edition, and is therefore equally serviceable to public authorities and others who find it necessary to ascertain whether particular persons are registered medical practitioners or not. The Council also prepares monthly lists of names added to and removed from, the *Register*, and particulars of the terms and conditions upon which copies of these lists may be made available can be obtained on application to the office of the Council, 44, Hallam Street, Portland Place London, W 1

Medical Products

Allen and Hanburys Ltd have published in book form their *Medical and Dietetic Products Price List* replacing *Medicamenta Recentia* the small book of notes on preparations which has been issued at irregular intervals in the past It gives concise descriptions of the specialties marketed by this firm, a list of sera and vaccines prepared at the Lister Institute and a therapeutic index.

B D H Medical Products is the title of a bound volume comprising the medical price list of British Drug Houses Ltd Besides a full list of names and prices there are included descriptive notes on highly specialized preparations which make up the series of B D H medical products Any reader who has not received a copy can have one free of charge by writing to the manufacturers, Graham Street, City Road, London N 1

Rayner and Co Ltd (Edmonton N 18) have issued a booklet for medical men on the subject of their preparation Lembar which consists of natural lemon juice and a solution of extracts of barley with cane sugar and dextrose. In a pocket at the end of the booklet are diet sheets prepared by a hospital dietitian Copies may be had from the makers.

Corrigendum

In Dr Hector Maclean's reply to an inquiry on the subject of buccal and lingual ulcers on page 1102 of our issue for November 27 he through a printer's error is made to refer to *Staphylococcus viridans* The sentence in its correct form ends each case was swabbed and yielded a growth of *Streptococcus viridans* in pure culture or as the predominant organism"

Disclaimer

Mr R STUPPEL (resident surgeon Mexborough Montagu Hospital) writes A considerable amount of very undesirable publicity has been given me in the Press recently I wish to say that it was entirely without my knowledge or consent.

bought a batch which were already in oestrus, and were giving positive results when we got them from the dealer The female fish is the most useful but until oestrus takes place they cannot be differentiated from the males, they are a great nuisance to look after, and one can never be sure that they are not having an oestrus of their own These facts caused us to abandon this test also, although other workers have written enthusiastically about it—I am, etc,

Portsmouth Nov 27 STANLEY WAY

Puerperal Fever in General Practice

SIR—It seems to me that the future general practitioner will be quite satisfied if he wears a mask and injects sulphanilamide into his patient His midwifery will not matter The fatal issue in the case reported by Dr Price Williams (*Journal* November 27, p 1094) might just as easily have been brought about by bad asepsis—dirty needles badly sterilized gloves or septic sutures—as by throat infection Let the general practitioner be taught to use masks let him be taught to use sulphanilamide but let good practical obstetrics be in the foreground of his technique This aspect of the subject seems likely to be forgotten—I am etc,

Dublin Nov 27 BETHEL SOLOMONS

Expulsion of Placenta in Advance of Foetus

SIR,—The case reported by Dr J W Nankivell in the *Journal* of September 11 (p 527) reminds us of a similar one admitted into the Government Civil Hospital recently The patient was an Indian aged 35 years and in her eleventh pregnancy She was admitted at 3 a m on August 8 coming from the country with a history of profuse vaginal haemorrhage at 9 p m the previous day

On examination the fundus was at the level of the umbilicus Per vaginam it was found that the placenta was almost completely extruded into the vagina the cervix was three quarters dilated and the foetus occupied a transverse lie Without much difficulty an internal version was performed and a leg pulled down An hour and a half later the patient delivered herself of a stillborn female child of about six months gestation Notwithstanding the abundance of the haemorrhage the patient's condition on admission was fairly good and she stood the necessary manipulations well without any anaesthetic Her pulse was somewhat rapid but it rallied soon after the subcutaneous injection of one litre of normal saline No further haemorrhage occurred from the time of her admission until her delivery The puerperium was uneventful and the patient was discharged a week later

We did not think of publishing this case, as we were not aware of its extreme rarity In this remote corner of the globe reference literature is sadly lacking and we had no means of gauging the frequency of this anomaly—We are etc

Civil Hospital Port Louis Mauritius Nov 5

Prophylaxis of Ophthalmia Neonatorum

SIR—The following note may be of use to Lieut-Colonel H Williamson (*Journal* November 13 p 995) During the past twelve months (November 1936 to November 1937) there were 2 701 babies born in the Rotunda Hospital Of these two developed ophthalmia neonatorum, and in both the gonococcus was present in the smear In each case, however, all discharge had ceased after four days treatment, and no corneal ulceration developed The prophylactic routine in the Rotunda Hospital consists of two essentials First, the cleansing of the lids before they are opened with dry sterile cotton wool This should never be omitted and reliance placed solely on the use of drops Secondly drops of 1 per cent silver nitrate are instilled into each eye immediately after the cleansing As I have never known a severe attack of ophthalmia neonatorum to follow the use of 1 per cent silver nitrate, and have never seen any ocular damage result from its use I do not consider it wise to substitute another drug for one so well proven—I am etc,

Dublin Nov 24 L B SOMERVILLE-LARGE

Spinal Anaesthesia for Caesarean Section

SIR—We have been interested in the differences of opinion that have arisen on the subject of spinal anaesthesia for Caesarean section since the appearance of Dr H K Ashworth's article (*Journal* October 2 p 671) The last fifty cases requiring Caesarean section in the obstetrical department of this hospital have been given spinal anaesthesia as a routine measure No deaths resulting directly from the anaesthetic have occurred in this series The anaesthetic used has been tutocaine dissolved in the patient's own cerebrospinal fluid The ages of the patients have ranged from 18 to 40 years—We are etc,

Baghdad Nov 16

Protection against Ether Vapour

SIR—I have followed with interest your excellent series of articles on anaesthesia The medico-legal points have been admirably dealt with in the *Journal* of November 13 (p 976) but there is one point which, in the interests of both law and medicine requires clarification Mr Harcourt Kitchin states that some anaesthetists protect the patient's face with vaseline or oil It should, I think be made very clear that vaseline or oil should never be used on the patient's face until the administration of the anaesthetic has been brought to a close Quite low concentration of ether vapour will if the face is smeared with vaseline cause great irritation to the conjunctiva Actually such a procedure is probably the most certain way to produce an anaesthetic eye and I mention this fact as anaesthetists may be tempted to use vaseline to make a more gas tight junction between mask and face when giving gas and oxygen then if a little ether vapour has to be given the ether dissolves in the oil enters the eye and the damage is done—I am etc

R K ROBERTSON

Sheffield Nov 22.

Technique of Cataract Extraction during Narcosis

SIR—Mr Basil Graves's reply (*Journal* November 20 p 1047) to my letter (October 2 p 681) calls for a rejoinder It is gratifying to know that the difficulties as regards feeding and evacuation of the bowels and bladder that I visualized do not arise in his unconscious patients As in his reply there is no mention of the diseases that sometimes complicate cases is one to assume that all his patients have been old people in sound health, or that there

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

444 **Experimental Agranulocytosis**

In support of the view that agranulocytosis following medication is of allergic or anaphylactic origin G KRAUEL (*Klin Wschr* September 4 1937, p 1245) records the case of a man aged 26 who six years after eight weeks treatment with pyramidon for acute rheumatism took 0·3 gramme for toothache, and was next day sent to hospital as a case of diphtheria there was tonsillar swelling and pharyngeal ulceration and the blood picture was typical of acute agranulocytosis (white cells 600 per c.mm., 94 per cent being lymphocytes granular cells practically absent on sternal puncture) Recovery was complicated by a transitory pleurisy and a small pulmonary inflammatory focus To confirm the causation of the condition 2 mg of pyramidon was given six weeks later a general reaction with pyrexia cyanosis and the diminution of leucocytes from 12,000 to 7 200 per c mm was noted within two hours This test despite the minute dosage had serious results for a subacute pulmonary abscess formed which required thoracoplasty and nine months stay in hospital

445 **Pleural Adhesions**

D MICHETTI (*Arch med chir Appar resp* 1937 **12** 2 145) draws attention to the fact that pleural adhesions which may be present in cases of pulmonary tuberculosis may defeat the purpose of an induced artificial pneumothorax which is primarily to set the lung at rest If the lung is attached by adhesions to the chest wall it must move during respiration at the site of the adhesions while the free portion of the lung is collapsed The shorter the adhesion the greater is the traction on the lung and the smaller the band is in diameter the greater the potential danger A case is described in which a young man was suffering from pulmonary tuberculosis A left pneumothorax was induced and brought about the complete relief of symptoms Unfortunately a long adhesion developed opposite to the principal lesion but as it did not appear to be hindering recovery it was not divided For six years the patient appeared to be in comparatively good health although there were periods when some symptoms recurred But at the end of that time there was a flare up with fever cough and expectoration *X* ray examination showed a cavity under the left clavicle It was assumed that the original lesion had never completely healed owing to the presence of the adhesion which had made the pneumothorax incomplete It is also suggested that if this band had been divided during the first few months of collapse therapy a permanent cure might have been effected From this and other cases described the conclusions are drawn that adhesions should be divided whenever they are in the neighbourhood of a tuberculous focus whether they appear to interfere with the effect of the pneumothorax or not and that intervention should be carried out at an early date as delay only increases the danger of the procedure

446 **Calcinosis**

H A SALVESEN and J BOE (*Acta med scand* 1937 **92** 4–5 389) give a detailed account of two cases of calcinosis with which they illustrate their general survey of a disease which is so rare that in 1931 Steinitz could collect only thirty four published cases of universal calcinosis and seventy one of circumscribed calcinosis In the circumscribed form the calcium deposits are limited to the skin and subcutaneous tissues usually in the upper limbs of elderly women who have long suffered from cold hands and acrocyanosis Universal calcinosis is a much more serious disease of comparatively young folk and even children The calcium deposits may be so general that the patient is very stiff There is atrophy of the muscles with cachexia which often terminates fatally The difference between universal calcinosis and myositis ossificans is that while calcinosis is localized to the interstitial tissues of the muscles which undergo secondary atrophy myositis ossificans is a condition in which the muscles themselves become the seat of bone formation The authors patients were a girl aged 18 and a man aged 22 both of whom suffered from the universal form of calcinosis In both cases the calcium and phosphorus metabolism was normal and in the first case there was a complete calcium and phosphorus balance on a diet containing ordinary amounts of these substances On a diet poor in calcium and phosphorus but otherwise adequate there was a negative balance and the x ray investigation showed that the extra calcium excreted was taken from the pathological deposits At the same time there was a marked clinical improvement which enabled the patient to return to work Although the authors admit that the pathology of calcinosis is still in dispute they conclude that universal calcinosis is a dystrophic condition depending on the precipitation of calcium in tissues previously attacked by some inflammatory process

Surgery

447 **Fractures of the Pelvis**

L M RANKIN (*Ann Surg* August 1937 p 266) has reviewed a series of 449 cases of fractures of the pelvis collected from four different hospitals It was noticed that the incidence of this type of fracture has greatly increased and it is significant that 36 per cent of the cases followed motor car accidents while industrial accidents were responsible for a further 33 per cent Most of the patients were between 17 and 40 years of age and men were affected nearly twice as often as women Pain was the predominating symptom with difficulty in walking abdominal tenderness and crepitus as other common symptoms Multiple fractures of the pelvis occurred more often than single fractures The left pubic bone was fractured in 163 cases the right pubic bone in 149 The right ilium was fractured in ninety five cases the left ilium in eighty nine the right ischium in seventy cases the left ischium in seventy-two The left acetabulum was fractured in forty one cases and the right acetabulum in thirty two cases In the series there were forty one deaths Of the remaining cases 144 were discharged as cured and 249 were improved The average period of total disability for uncomplicated cases was sixteen weeks and it was twenty three weeks before regular work could be resumed Genito urinary and other complications were rare Physical therapy was of great value in treatment and if started early shortened the period of hospitalization

448 **Pyosalpinx Strangulated in a Hernia**

ABBELOOS and POHL (*Scalpel* Liege August 21 1937 p 1200) report an unusual case of strangulation of a pyosalpinx in an undetected ventral hernia This occurred in a very fat woman aged 40 who for several years had suffered from attacks of abdominal pain localized in the left iliac fossa and accompanied by fever and uterine discharge For twelve months menstruation had been irregular and more profuse than usual and at the time of admission to hospital there had been bleeding for the last fifteen days with intermittent pain in the epigastrium and left iliac fossa during the previous three days The

is no contraindication to his method of narcosis? The dread of operation is all the greater in ailing patients, hence the need for making them care-free is also greater When a new method involves the employment of such large doses as he uses, especially of more than one narcotic, trial in a large number of cases is necessary to ascertain its freedom from danger I do not know how often Mr Graves has used his method of narcosis, but if further experience proves it to be safe it would be of help in exceptional cases even to surgeons who prefer retaining the co-operation of the patient, and we shall have cause to be thankful to Mr Graves for his bold venture

As regards sitting the patient out of bed the next day, this has been my practice from the beginning of my ophthalmic career, irrespective of the technique of the operation Provided the patient is instructed to keep his head up and be gentle in all his movements no harm results My operations are mostly simple intracapsular extractions with retention of a conjunctival bridge, this is practicable as I extract the lens laterally with Elschnig's toothless capsule forceps But the conjunctival bridge is not essential to enable the patient to sit out of bed the next day, as before 1929 I only cut out a conjunctival flap, at the same time retention of a bridge is certainly preferable Unless under a mydriatic the pupil does not dilate sufficiently for the manipulation of the capsule forceps and the delivery of the lens, I never do an iridectomy I see no justification for mutilating the iris in a hundred cases to avoid a possible prolapse in one or two patients, especially as the process of mutilation is liable to produce complications that need not otherwise arise, quite apart from the cosmetic and optical advantages of an intact iris —I am, etc,

Eastbourne Nov 25 D V GIRI

Research in Rheumatism

SIR —*In 1925 the Chief Medical Officer in the Ministry* of Health defined the arthritic unit as an institution situated near and working in the closest co-operation with a large teaching school of *medicine or a university, which* would enable it to fulfil the purpose of research and observation, as well as treatment Here patients would come at the early stages of their disease for thorough examination by modern methods, diagnosis, and record, here the focus of infection would, if possible be found and removed, here the bacteriological and biochemical investigation of each case would be completed before the patient was passed on to other institutions, here orthopaedic surgery, if necessary, would be performed This is what I had in mind in saying that the St John Clinic through the help of Sir Frederick Menzies and the L C C, had at St Stephen's Hospital the first rheumatic unit

I fully value the individual research work done by Dr Poynton and do not fail to recognize that of the co operative work done by Dr Buckley and the bacteriologist, chemist, and radiographer at the Devonshire Royal Hospital in Buxton which approaches near to that of a rheumatic unit but fails in close association of orthopaedic surgery and postgraduate teaching The St John Clinic and L C C Unit does fulfil all the conditions laid down by Sir George Newman and elaborated by Mr Timbrell Fisher, who pointed out in his book on chronic arthritis (1929)

There must be a physician thoroughly experienced in such cases a surgeon with official knowledge and interest in the orthopaedic problems concerned a bacteriologist a biochemist specialist skilled in metabolic investigations experts in the various forms of physiotherapy a radiologist, a dentist and a nose and throat specialist There should be a modern operating theatre where open operations upon joints can be performed and a smaller one for manipulations or other minor operations '

—I am, etc,

St John Clinic, London, S W 1, Nov 29 LEONARD HILL.

SIR —My attention has been drawn to the letter from Sir Leonard Hill in the *Journal* of November 20 (p 1045), in which he mentioned statements in the Press to the effect that the new department for rheumatism and arthritis, now in course of construction, at the Hospital of St John and St Elizabeth is the first of such units, and pointed out that the St John Clinic and Institute of Physical Medicine has already been carrying out research work in rheumatism and arthritis for the past two or three years While agreeing with Sir Leonard Hill I should like to point out that the new department at the Hospital of St John and St Elizabeth is, however, the first unit to be founded under the auspices of the Empire Rheumatism Council, and the first department solely devoted to research into rheumatism and arthritis to be attached to a general hospital —I am, etc,

F DUDLEY HOBBS
Secretary Hospital of St John and St Elizabeth

London, N W 8 Nov 22

Legacies for Medical Charities

SIR,—The figures submitted by Dr Henry Robinson in your last issue as to the considerable number of large estates left by members of our profession, and the infrequency amongst them of bequests to the medical charities, are really heartbreaking I am reminded by them that some three or four years ago one of your readers wrote proposing that if nineteen others would do the same he would engage to leave £100 in his will to a medical charity I had the curiosity some time later to inquire how many responses had been received to this offer the answer was one We most certainly need waking up, and I trust that Dr Robinson's article will evoke better results than were obtained four years ago Incidentally, I have recently heard on good authority of a member of our profession who died a few months ago and left upwards of £70,000 He had subscribed a guinea to one of the charities for a number of years, but when, after a decent interval, his widow was approached to continue this subscription she replied that she could not afford to do so —I am, etc,

Nov 30 EX-CHARITIES DIVISIONAL SECRETARY

New Clinical Opportunities fo omen Students

SIR —There are twelve medical schools in London at the present time To the superstitious the addition of another may seem ill omened, but I hope that the majority of your readers will welcome the fact that the University of London has recently approved the West London Hospital as an institution for the purposes of the M B, B S degrees for external students

Nine of the London medical schools exclude women entirely, and I imagine that London is the only city in the world where such a state of affairs exists Women who wish to study medicine in London have great difficulty in finding the necessary accommodation at the three hospitals which will accept them Many are driven to the provinces and not a few have to give up all thoughts of following a profession which is offering increased scope to women of the right type

patient was very constipated, the abdomen was distended, and there was some nausea After an enema the pain became more severe A mass could be felt in the left iliac fossa, and since rectal and pelvic examinations proved negative a diagnosis of strangulated ventral hernia was made Operation was carried out under spinal anaesthesia and disclosed a tumour the size of a large egg, which had herniated through the thin and weak abdominal muscles Incision of the hernial sac showed that it contained a left-sided pyosalpinx and omentum and a loop of sigmoid A quantity of fetid pus was evacuated from the pyosalpinx and the tube was removed, the other contents being returned to the abdomen Radical cure of the hernia was carried out Convalescence was normal and the patient left hospital completely cured It would appear from the operative findings that the patient must have been suffering from salpingitis for many years, having also a hernia which was not observed, owing to the adiposity of the abdominal wall, until the strangulation of the pyosalpinx made operation necessary

449 Serum Treatment of Appendicitis

C D Bartels and C Dalsgaard (*Ugeskr Laeg*, September 2, 1937, p 906) compare the mortalities from appendicitis in a Danish hospital according to whether the patients were or were not given intravenous injections of certain sera prepared at the State Serum Institute in Copenhagen or obtained from abroad The 703 patients operated on for appendicitis in the period 1921–30 were not given serum, and the mortality was 7 per cent. (fifty deaths) The 544 patients operated on for appendicitis in the period 1931–6 were given serum whenever diffuse or limited peritonitis or gangrene of the appendix was diagnosed, or when the interval between the onset of symptoms and the operation was longer than forty-eight hours The mortality was 2 3 per cent (thirteen deaths) To make their comparison as fair as possible the authors classify their cases in the two series according to the condition of the appendix and peritoneum at the time of operation, and the length of the interval between the onset of the disease and the operation They come to the conclusion that the remarkable decline in the mortality from 7 to 2 3 per cent cannot be credited only to the serum treatment, but they attach considerable importance to it, not only on account of the statistical evidence but also because clinical observation has taught them that the serum, given at the end of the operation and usually in a single dose, has a remarkably beneficial effect in hastening the fall of temperature and restoring the normal action of the bowels Details of the composition of the State Serum Institute's serum are given

450 Sterilization of Males

M Mennenga (*Beit klin Chir* 1937, **166**, 3, 360) describes the technical difficulties encountered in nine cases among 476 sterilizations carried out on eugenic grounds In two cases there was an aplasia of the vas deferens, although the testicles were normal In one case the vas could not be found because, as it transpired later, it was cut through during an operation for inguinal hernia in childhood In another case the vas was very thin on one side but of normal thickness on the opposite side although the two testicles were of equal size In another case again one testicle was hypoplastic and the corresponding vas missing, while in two further cases of cryptorchism no vas deferens could be detected In cases in which the vas cannot be found the author advises exposure and resection of the epididymis An undescended testicle situated in the inguinal canal is best resected provided the other testicle is normal Ligature alone of the vas is insufficient as there is always the danger of recanalization It is therefore advisable to resect 5 to 6 cm without tying the two ends Finally the author urges the importance of the histological examination and conservation of the resected part.

Therapeutics

451 Parenteral Administration of Vitamin A

G Lodi (*Rass Clin Terap* September 17, 1937, p 206) alludes to recent reports in coeliac disease of excessive faecal excretion of vitamin A and of an absence of its increase in the serum (or of clinical improvement) after its oral administration The biological test of ocular photosensitivity has shown some degree of latent A-avitaminosis and xerophthalmia is an occasional complication In a typical case of coeliac disease and in one of xerophthalmia with spasmus nutans (salaam convulsions), both complicated by gastro-intestinal disturbances rendering utilization of orally given preparations impossible, Lodi saw prompt and pronounced improvement follow parenteral administration of vitamin A in combination with cholesterol

452 Angina Pectoris

M Hochrein (*Med Klinik*, October 15, 1937, p 1385) states that every case of angina pectoris demands individual measures of treatment adapted to the organic lesions present, to the patient s personal peculiarities, and to extra-cardiac conditions in the gastro-intestinal tract or in foci of sepsis It must be borne in mind that while angina pectoris is an expression of coronary insufficiency in relation to cardiac work, other factors must be concerned since, as Hochrein has shown, coronary occlusion occurs without pain in about 40 per cent of cases, and only about 15 per cent of patients with calcification of the coronary arteries report angina These other factors are to be found in a hyperexcitability of the nervous system, which may be constitutional, familial, or acquired—for example, by excessive indulgence in games in youth or excessive mental strain in middle life It is important in treatment to decide, if possible, whether the angina is chiefly due to coronary insufficiency of organic basis or to vasomotor insufficiency In a series of 163 recent cases Hochrein found necessary treatment for gastritis in eighty-nine, for adiposity in thirty four, and for dental or tonsillar infection in twenty two Treatment by reduction of bodily and mental exertion is essential, especially when organic coronary disease is present Nitrites have not been used by Hochrein for many years, he finds them seldom effective, and productive of stupor, vertigo, reactive hyperexcitability, and a 'nitrite habit' comparable with the morphine habit Adrenaline, in spite of dilating the coronary arteries, is unsuitable, it raises aortic pressure and thus increases the demands on the heart Hochrein prefers (1) in slight cases, caffeine and barbiturates, (2) in severe cases, dextrose (daily intravenous injections of 20 c cm of 30 per cent solution), and calcium gluconate or organ extracts such as Jacarnol Sometimes good results follow inhalations of 4 to 5 per cent carbon dioxide, or short-wave irradiation of the heart Treatment of the nervous factor is as important as, but more difficult than, that of the haemodynamic component it comprises, in addition to psychotherapeutic measures, exhibition of bromides and barbiturates, and is often helped by hydrotherapy, massage, and gymnastic treatment Hochrein does not advise operation for the relief of anginal pain, which he believes is of value as a warning sign

453 Ergotamine Tartrate for Migraine

A Guldager (*Ugeskr Laeg* September 23, 1937, p 999) has found in his hospital practice that attacks of migraine invariably yield to subcutaneous or intravenous injections of from 0.25 to 1 mg of ergotamine tartrate This drug was isolated in 1918 by Stoll, and for several years, since it is more soluble and stable than the alkaloid itself, was employed as gynergen almost exclusively by gynaecologists The subsequent discovery that the drug had a

The University of London, in conjunction with the West London Post-Graduate College, has been exploring the possibility of remedying this situation for over three years, and the present recognition is the first step The sister Universities of Oxford and Cambridge have also granted recognition, and it is hoped that the other examining bodies will follow suit

A small number of undergraduate students is already at work at the West London Hospital, where the clinical facilities should be in no way inferior to those available at other and older schools A considerable number of applications for next year has already been received, and it is hoped that this letter may bring the matter to the notice of many who are at present ignorant of this important new development

While it is anticipated that the new school will be patronized largely by women whose difficulties it has been designed to meet it is not proposed that it should necessarily be confined to the one sex We have been accustomed to cater for postgraduate students of both sexes for the past forty years, and it seems desirable that the principle of sex equality should be preserved Moreover, there is no immediate intention of giving up the postgraduate side of the work of this college although that may ultimately be necessary—I am, etc,

MAURICE SHAW
Dean of the West London Post Graduate College

Nov 23

Conscious Behaviour

SIR—In the account of the Huxley Lecture in the *Journal* of November 27 (p 1082) Professor E D Adrian is reported as saying that there was general acceptance of the idea that conscious behaviour was guided by a balance of unconscious forces and would be impossible without them ' Would it not be more correct to say that conscious behaviour was built upon ' or ' energized by, or impulsed by " unconscious forces, rather than guided? Surely the neocortex or neopallium is the distinctively human organ of a personal intelligence and discriminative power—*without which we should be reduced to irresponsible robots*—I am, etc,

Beckenham, Nov 28 COURTENAY C WEEKS

The Sex Ratio

SIR—There has appeared some correspondence in your columns (*Journal* November 6, p 936) regarding the ratio of males to females from childhood to old age Statistics show that 105 to 106 males are born to every 100 females but in old age the females outnumber the males The number of male children actually conceived is much higher, being about 120 to every 100 females The number of male foetuses that die before birth owing to miscarriages and stillbirths accounts for the reduction of the figure As the number of sperms bearing the X chromosome (female begetting) and the Y chromosome (male begetting) are produced in exactly equal numbers there should be an exactly equal number of male and female children born This is not so Figures for all countries show the male preponderance The reason is that excessive vaginal acidity hinders conception—the basis of practically all chemical contraceptives is acid in one form or another Therefore in order that the woman should conceive at all the vagina must be alkaline or less acid This favours the male begetting sperms, hence the male preponderance—I am, etc.,

London, W 1, Nov 21 D H SANDELL.

Obituary

O CHARNOCK BRADLEY, M D, D Sc

Principal Royal Veterinary College, Edinburgh

The death took place at a nursing home in Edinburgh on November 21 of Principal Orlando Charnock Bradley, head of the Royal (Dick) Veterinary College, Edinburgh Dr Bradley was born in 1871 in Lancashire, and after studying for the veterinary profession qualified M R C V S in 1892 Being specially interested in anatomy, he became assistant to the late Professor Williams in the Veterinary College, and at the same time prosecuted the study of medicine at the University of Edinburgh, where he graduated M B., Ch B in 1900 He was appointed Goodsir Memorial Fellow in that University in 1903, and as the result of his research work gained the degree of D Sc in 1905 In 1907 he took the M.D He joined the staff of the Royal (Dick) Veterinary College in 1900 as professor of anatomy, and at the same time was appointed lecturer on comparative anatomy in the University of Edinburgh

In 1911 he was appointed Principal of the Royal (Dick) Veterinary College, and conducted the transfer of the college from its old premises in Clyde Street to the new building which it at present occupies The erection of the College was considerably delayed by the war but Principal Bradley s strenuous efforts were effective both in raising funds for it and in completing the buildings Under his direction the College has made remarkable progress, its students increasing from some seventy or eighty in 1911 to over 300 at the present time His eminent services were recognized last year when he celebrated his semi jubilee as principal and was presented with his portrait Dr Bradley became a member of Council of the Royal College of Veterinary Surgeons in 1911, and was its president in 1920–2, while from 1914 to 1919 he was chairman of its Parliamentary Committee He took a prominent part in the formation of the National Veterinary Medical Association, and was president of that body for several years up to 1922 He was a distinguished member of the British Medical Association, which he joined in 1903, and he acted as president of its Section for Comparative Medicine at the Annual Meeting in Edinburgh in 1927 He was also a Fellow of the Royal Society of Edinburgh

Dr Bradley conducted much research work, and his published papers in connexion with veterinary medicine number over one hundred He was also the author of a *History of the Edinburgh Veterinary College* (1923), *The Topographical Anatomy of the Horse* (1920) *The Structure of the Fowl* (1915) and *The Topographical Anatomy of the Dog* (1927) Dr Bradley was also an ardent horticulturist, and was well known for his cultivation of new varieties of delphinium and other flowers at his country house near Gifford He had a world wide reputation not only for the research which he carried out but also as an organizer of the veterinary profession and much of the advancement that has taken place in veterinary medicine in recent years is attributable to his efforts

The funeral took place on November 24 at the Edinburgh Crematorium, and a memorial service was held in Hope Park Church which was attended by large numbers of the staff and students of the Royal (Dick) Veterinary College, as well as by representatives of other bodies with

marked effect on the sympathetic system in experimental animals led to its employment in other conditions Its failure when first given in cases of migraine must be traced to its administration by the mouth, and it is thanks to American observers that the merits of this drug when given by injection in migraine have been demonstrated When the most suitable dosage has been found for any patient there is no need to change it as it remains equally effective Even when it has been taken for more than a year and more than 100 injections have been given no ill effects have been observed But the action of the drug is only symptomatic As the injections (most of the author's patients received subcutaneous injections) raise the blood pressure this treatment is contraindicated by the co existence of arteriosclerosis or hyperpiesis Gynergen is put up in ampoules containing 0.25 to 0 5 mg of ergotamine tartrate If the migraine does not cease in two to three hours after the injection of 0 5 or 0 25 mg the injection can be repeated with one or other of these doses The patient should go to bed after treatment as an injection is apt to be followed by lassitude and drowsiness

Anaesthesia

454 New Hypertensive Agent

E DESMAREST (*Anesth et Analgés* June 1937 p 391) recommends the use of a new preparation—pressyl—for the treatment of hypotension before during and after operation and particularly in spinal analgesia It is a combination of camphramine or beta-diethylcarbonamide of camphosulphonyl N methylpyridine a cardiac and respiratory stimulant and of pressedrine, or alpha amino phenylethylcarbinol sulphate whose action resembles that of adrenaline and ephedrine Pressyl may be administered orally subcutaneously or, in emergency intravenously It elicits a rise of blood pressure as great as that caused by adrenaline though not quite so rapidly while its effect lasts about twice as long as that of ephedrine

455 Anoxia in Anaesthesia

T A B HARRIS (*Brit J Anaesth* July 1937 p 141) discusses the physiology of the oxygen supply to the tissues and emphasizes the importance of maintaining complete saturation of the arterial blood with oxygen during anaesthesia for upon this depend the life and functioning of all cells and the physiochemical activities which go to maintain the normal acid base equilibrium of the body He admits the advantages of nitrous oxide as an anaesthetic but considers that no attempt should be made to reinforce it by producing anoxia which must be unphysiological and harmful He particularly condemns the secondary saturation of McKesson

456 Evipan in Cocaine Poisoning

H J DALY (*Anesth and Analges* September–October 1937 p 293) reports a case which illustrates the antagonism to cocaine and its substitutes commonly attributed to the barbiturates A man of nearly 70 was accidentally given a hypodermic injection of 3 grains of cocaine hydrochloride and soon showed pallor rapid pulse and generalized muscular twitchings particularly of the extremities As his condition was deteriorating in spite of oxygen and carbon dioxide inhalations and the injection of 1/30 grain of strychnine 3 c cm of evipan solution were given intravenously forty five minutes after the cocaine was injected The convulsions ceased the pulse rate dropped and the patient slept for about fifteen minutes Forty minutes later as severe spasms with pain and dyspnoea had returned a further 3 c cm of evipan was given resulting in ten minutes sleep and improvement on awakening Half an hour later as breathing had again become difficult a further 2 c cm was given and a short sleep was again followed by improvement and a slower pulse Four hours after the injection of cocaine he had apparently recovered completely he slept well after a hypodermic injection of morphine, and showed no ill effects next day

457 Comparative Anaesthetic Mortalities

H WEESE (*Wien klin Wschr* September 10, 1937 p 1267) compares the advantages and disadvantages of the volatile general anaesthetics such as ether, and of the liquid anaesthetics such as evipan pernocton and avertin He records that there have been forty two fatal accidents in 1 000,000 administrations of evipan, roughly one fatal accident in every 20 000 to 25,000 cases This is better than the figures for ether, which show one fatal accident in every 14 000 cases More recent statistics give one fatal accident in 65,000 administrations of evipan and one fatal accident in 30 000 for ether and oxygen anaesthesia

458 Microspinal Anaesthesia for Cystoscopy

P FJELDBORG (*Ugeskr Laeg* August 19 1937 p 872) reports from his hospital in Denmark his encouraging experiences with the system of so-called microspinal anaesthesia introduced in 1934 by the Hungarian surgeon Bugyi It is an intradural anaesthesia effected by the injection of only 1 c cm of a solution containing 16 mg of novocain and 0.2 c cm of a 0 1 per cent solution of adrenaline (about 4 drops) The anaesthesia affects the three lowest sacral nerves supplying the external genitals urethra prostate, bladder anus and lower part of the rectum The duration of the anaesthesia is from one to one and a half hours and there is no paresis of the legs to hamper the patient's movements Since March 1934 the author has tested this method in 140 cases in 108 of which cystoscopy was undertaken with or without catheterization of the ureters or pyelography In the remaining cases some operation was performed, such as electrocoagulation of a tumour of the bladder excision of fistula in ano removal of a cervical polyp or resection of the prostate *according to the Bumpus technique* Only in two cases did the anaesthesia prove ineffective, and its failure in one of these cases may have been connected with the fact that the cerebrospinal fluid was macroscopically blood stained on lumbar puncture The author considers microspinal anaesthesia a very useful substitute for general anaesthesia in these cases

459 Spinal Anaesthesia

A W ADAMS (*Bristol med chir J* 1937 **54** 204, 143) describes his experiences of spinal anaesthesia with spinocain in 1 529 cases of all varieties of which about 90 per cent required no additional anaesthesia He employs small doses and controls the area of anaesthesia by varying the site of injection and the tilt of the table For the perineal region 0 5 c cm is injected between the third and fourth lumbar vertebrae with the table sloped 20 head downwards for the leg 1 c cm injected between the second and third lumbar vertebrae for the abdomen 1 35 c cm injected between the first and second lumbar vertebrae with the table tilted 5 head upwards and for the kidney 1 3 to 1 4 c cm The spinocain is mixed with an equal volume of cerebrospinal fluid and reinjected Ephedrine is given as a routine beforehand but the author is not in favour of morphine or other hypnotics or of additional general anaesthesia If the latter is required nitrous oxide and oxygen is probably best The value of spinal anaesthesia in upper abdominal operations is more debatable and here additional general or local anaesthesia is more often necessary It is particularly valuable for cystoscopy since out-patients can leave hospital after a few hours rest. Contraindications are low blood pressure severe haemorrhage chronic asthma or bronchitis and poor surgical risks in general

which the late principal had been associated, including the Corporation and University of Edinburgh and various veterinary associations

DR IVOR NICHOLAS LEWIS died at his home in London on November 20 Born in 1905, he was educated at Christ's College, Brecon, and St George's Hospital He qualified M R C S, L R C P in 1927, and was casualty officer, house-surgeon, and house-physician at St George's, and afterwards resident medical officer at St Andrew's Hospital, Dollis Hill He returned to St George's as a resident anaesthetist, and in 1930 was appointed assistant anaesthetist, and in 1931 anaesthetist, to the hospital His other appointments were those of honorary anaesthetist to the Metropolitan and Brompton Hospitals, and to St Andrew's Hospital, Dollis Hill, and he was on the consulting anaesthetists rota of the London County Council Ivor Lewis, although only 32 years old at the time of his death, had been well known for some years for his skill and ability He qualified at the period when the science of anaesthesia was making rapid strides, and he was always a pioneer in the introduction of new methods In 1931 he devised the gas and-oxygen machine which is known by his name, and which combined portability with great efficiency In 1930 he published an article in the *British Journal of Anaesthesia* on avertin technique in thyroid surgery From its earliest days he had been a great advocate of the use of avertin In September of this year his contribution on endotracheal anaesthesia to a series of invited articles then being published in the *British Medical Journal* evoked a lively correspondence Apart from his professional interests he was a keen yachtsman, and a prominent member of the United Hospitals Sailing Club, of which he was for several years honorary treasurer At the time of his taking over that office the club was in a serious position financially when he retired a short time ago it was established on a firm financial basis His tragic death will be deeply regretted by many friends and colleagues

Colonel ERNEST ARNOLD WRAITH, C B.E, D S O, T.D, who died at Queen Mary's Hospital, Roehampton, on October 30, at the age of 61, was the younger son of the late Alfred Wraith of Ossett, Yorks He was educated at Wakefield Grammar School and the Leeds School of Medicine, and qualified as M R C S, L R C P in 1899 After holding appointments as house-physician at Leeds General Infirmary and the Clayton Hospital, Wakefield, he served throughout the South African war as a civil surgeon During the great war he was in command of the 1st North Midland Field Ambulance, 46th Division, and later was A D M S, 58th Division He received the D S O and C B.E and was mentioned in dispatches After the war he became D C M S in the Ministry of Pensions, and in that capacity was widely known and esteemed He had been a member of the British Medical Association for twenty-four years, and was assistant honorary secretary of the Shropshire and Mid-Wales Branch from December, 1924, to October, 1926

DR WILLIAM BLACKLEY DRUMMOND died on November 16 at Dunfermline He graduated in medicine at Edinburgh University in 1891, with first class honours, and proceeded M D in 1918 After filling the post of house-physician at the Royal Infirmary and the Royal Sick Children's Hospital he engaged in private practice He became a Member of the Royal College of Physicians of Edinburgh in 1899, and was later elected to the Fellowship He was a man of wide interests being specially conversant with diseases of children and with the mental development of the child, while he maintained his leaning towards Natural Sciences and was an examiner for the Royal College of Physicians in biology He was elected medical superintendent at Baldovan Institution in Dundee, where he was able to pursue his investigations of the Psychology of Child Life and its aberrant manifestations Dr Drummond was a man of gentle and amiable disposition, with a fund of quiet humour and although for a few years he had been out of touch with his former colleagues, on account of his indifferent health, he was always remembered by them for his attractive personality He joined the British Medical Association in 1896

We regret to record the death at Newton Abbot on November 13 of Mr JOSEPH JOPLING BROWN, at the age of 51 A native of Darlington, he received his early education at Bootham, York, and Dalton Park, Manchester, and was for two years a schoolmaster before beginning medical study at Newcastle-on-Tyne He graduated M B, B S of the University of Durham in 1911, and obtained the M S degree and the F R C S Ed in 1914 He had been a house-surgeon to the Greenbank Hospital, Darlington, and the Royal United Hospital, Bath, before serving as a temporary surgeon in the Royal Navy during the war On returning to civil life he practised at Barnsley, and in 1921–2 was honorary secretary of the Barnsley Division of the British Medical Association Fifteen years ago he moved to Newton Abbot, and became district medical officer and public vaccinator, and was appointed honorary surgeon to the Newton Abbot Hospital He leaves a widow, one son, and two daughters

We regret to announce that Colonel WILLIAM KITSON CLAYTON C M G, R.A M C, T.A (ret), died at Wakefield on November 12, aged 77 He was educated at Yorkshire College, Edinburgh, and Brussels, and took the L R C P and S Ed in 1884, and subsequently the M D at Brussels in 1892 He served for many years in the R.A M C, T.A, in which he rose to the rank of colonel During the war of 1914–18 he served in France and Flanders, where he was commanding officer of No 57 West Lancashire Casualty Clearing Station, and later A.D M.S of the 61st Division He was mentioned in dispatches in the *London Gazette* of January 1, 1916, January 4, 1917, and December 30, 1918, and received the C M G as well as the medals He was also a Commander of the Order of St John of Jerusalem In civil life he was one of the best known medical men in Wakefield He had been a member of the British Medical Association since 1889

We have to announce with regret the sudden death of DR DAVID ANDERSON FARQUHARSON on November 16 at the age of 64 The third son of Dr Farquharson of Dollar, he was educated at Dollar Academy and George Watson's, Edinburgh He graduated at Edinburgh University as M B, C M in 1894, and obtained the F R F P S Glasg in 1904 and the D P H Calcutta in 1921 Soon after qualifying Dr Farquharson became one of the most successful coaches in physiology for the University and the Royal College of Surgeons of Edinburgh, and later became professor of physiology at St Mungo's College, Glasgow During the war he served as captain, R A M C, at Gallipoli and in India He was then appointed senior medical officer to the Darjeeling District Medical Association, and was medical officer of health for that district He retired three years ago to take up his residence at Magdala Road, Nottingham He was joint author of Clarkson and Farquharson's *Textbook of Physiology* An accomplished pianist, a great reader and student, a man of generous good-heartedness, he has left many friends, who with his old students and colleagues sincerely regret his sudden death

DR ALEXANDER HILL GRIFFITH died in a nursing home at Woking on November 25 Dr Hill Griffith was 77, and for some time past had been in poor health He was born in Aberdeen the seventh son of Charles Fox Griffith, J P and was educated at the Grammar School and University of Aberdeen, where he graduated M B, C M in 1880, going on to the M D in 1883 He then began at the Manchester Royal Eye Hospital, as house surgeon

such as sufferers from chronic sepsis or advanced malignant disease In the series the only complications were a few cases of headache and two cranial nerve palsies Three deaths occurred For the treatment of collapse 1 c cm of 1 in 1,000 adrenaline is given subcutaneously or intravenously, the table is tilted into the Trendelenburg position, and, if necessary, artificial respiration is begun

Obstetrics and Gynaecology

460 Heart Disease in Pregnancy and Labour

According to W Hagedorn (*Münch med Wschr* August 6, 1937, p 1246) the prognosis of heart disease during pregnancy is largely dependent, apart from the degree of decompensation, on the time at which efficient treatment is instituted Differentiation of slight decompensation from the physiological cardiac changes of gestation is difficult, either by clinical or by radiological examination a careful clinical history is of the greatest value In a series of 8,572 pregnant patients 10 17 per cent had cardiac murmurs, 9 45 per cent being judged "accidental" and the remaining 0 72 per cent found to indicate valvular or myocardial defects Apical were more significant than basal murmurs Mitral regurgitation led usually to cardiac failure in the later months of pregnancy, mitral stenosis and myocardial disease to failure in the early months In four-fifths of a series of sixty-two severe cases of heart disease during pregnancy labour went to term. There were seven deaths from heart failure, five during the puerperium and two within five weeks, but three patients who died were in labour on admission and had not had treatment, which is strictly conservative and never includes Caesarean section Even in compensated cases digitalis and dextrose are given for a few days before labour, which is usually terminated by the application of forceps at the outlet under local anaesthesia As the head is delivered a weight is applied to the abdomen to compensate for the sudden fall in abdominal pressure As a vasomotor stimulant in labour strychnine is used, adrenaline being regarded as dangerous because it causes resistance in the splanchnic vessels Before and during labour cardiazol, caffeine, or intravenous strophanthin may be given digitalis is invariably administered during the first days after labour In only about 10 per cent of cases is pregnancy voluntarily interrupted—after the failure of strophanthin and dextrose treatment Abortion is then induced in the early months by dilatation and curetting or by anterior colpohysterotomy, sometimes followed by tubal sterilization.

461 Resection of the Hypogastric Nerves

A Spreng (*Schweiz med Wschr* September 18, 1937, p 897) considers dysmenorrhoea as a form of hypogastric plexalgia characterized by pelvic pain, which is either constant or occurs only in attacks during the menstrual periods Micturition is frequently painful, and there may also be frequency, defaecation may be painful There is usually a vaginal discharge, and intercourse is often painful, vaginal examination is almost unbearable The usual therapeutic measures are almost always without effect The author advocates the resection of the hypogastric plexus as practised by Cotte, and describes the operative technique Of fifteen cases of primary dysmenorrhoea treated in this way, eleven were completely cured and three improved Of fifteen cases of secondary dysmenorrhoea, eight were cured, one improved and six remained uninfluenced Metrorrhagia was relieved in twenty out of thirty-two cases and in four cases of scanty menstruation the flow was increased In seven cases of irregular menstruation the flow became regular In two-thirds of the cases the headache and vomiting which previously accompanied menstruation were relieved, there was also relief of dyspareunia In some cases even partial resection of the plexus may give relief

462 Galvanocauterization for Cervical Gonorrhoea

M Weinkamm (*Zbl Gynäk* September 4, 1937, p 2117) recommends the galvanocautery for acute and chronic gonorrhoeal cervicitis The cautery, which is about 2 cm long, consists of a thin platinum wire bent in the shape of a hairpin, and has at its end a small ball, which protects the internal os of the uterus The cautery is moved up and down the cervical canal until the whole of the mucous membrane is gradually coagulated The best time for the treatment is about eight to ten days after the beginning of the menstruation The coagulum, which is in the form of a cylinder 5 to 7 mm thick, separates after three to five days, while the regeneration of the tissues takes about fourteen to eighteen days Eighteen out of twenty cases of gonorrhoeal cervicitis treated by this method have been permanently cured

Pathology

463 Haemophilia in Women

S Löfgren (*Nord med Tidskr August 21, 1937, p 1373*) has examined four generations of a haemophilic family in Stockholm with special reference to the teaching advanced in 1925 by Schloessmann He maintained that, although there may be no fatal cases of haemophilia on the distaff side, certain female members of haemophilic stock may have a delayed rate of coagulation of the blood, examination of their blood may allow some estimate to be made of the probability of haemophilic tendencies appearing in their offspring Löfgren's investigation deals with nine females whose blood was examined with special reference to the rate of coagulation, capillary resistance, the blood calcium content, the thrombocyte count of capillary blood, etc In five cases he found an increased tendency to bleeding and a prolonged coagulation period While none of these cases could be considered haemophilic in the strict sense of the term, the author is inclined to agree with Schloessmann in interpreting the abnormal conditions found as a sign that the females concerned were capable of transmitting genuine haemophilic properties to their male offspring On the other hand, the author does not go so far as to argue that if a female member of a haemophilic family shows none of the slight abnormalities already referred to, she cannot transmit haemophilia to her male issue It would seem from these observations that various blood tests of female members of a haemophilic family will show which of them are the most likely to transmit haemophilic properties to their male offspring, but will not, if perfectly normal blood conditions are found, definitely exclude this possibility

464 Cell Forms in Seminal Emissions

M Michael and K Joel (*Schweiz med Wschr* August 14, 1937, p 757) investigated several seminal emissions from each of 130 men After suitable staining, preparations were microscopically examined for their cell content In normal ejaculations they found from 100,000 to 800,000 cells per c cm—that is, 1/4 to 1 per cent of an ejaculation consists of cells In healthy emissions they discovered two types of cell arising from the testicular tubules—spermatides without a nucleus and spermatides with one eccentric nucleus or three to eight nuclei, and spermatocytes, there were also polygonal epithelial cells arising from the epididymis In pathological emissions they found spermatogonia, Sertoli, and giant cells from the walls of the testis an increase of normal polygonal cells from the epididymis, and a number of miscellaneous cells, including leucocytes and urethral cells Clinically, microscopical examination of a seminal emission is an aid in the diagnosis of (1) degenerative or regenerative changes in the testis (2) atrophic changes in the testis, (3) changes in the efferent ducts, and (4) changes in the ejaculatory or urinary tracts

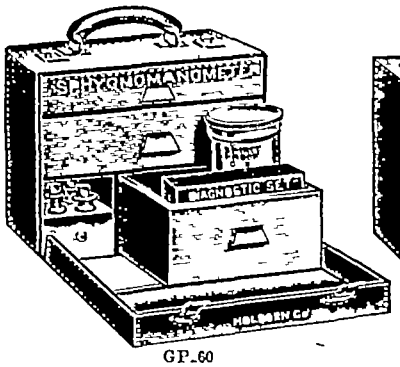
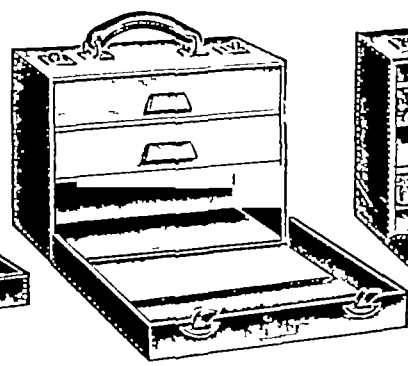
The "Malnutrition" controversy



"Ordinary mixed diet" unreliable as a source of Vitamin B_1

An editorial statement in the B M J, 16th Oct, 1937, page 753, that "Vitamin B_1 deficiency [is] an outstanding fault in the diet of many millions of people" gives added weight to the result of a large scale investigation in which 90 1% out of 2,000 patients showed improvement in health when their diets were supplemented with Bemax

> In Constipation 88 8% in Anorexia 80 0% in Malnutrition 78 4%, in Colitis 79 5% in Indigestion 82 5% in Intestinal Toxemia 80 6% in Asthenia 87 3% showed improvement *Of supposedly normal subjects mostly physicians themselves or members of their families 86 4% showed definite benefit in health from the use of Bemax*



It is impossible to escape the conclusion that chronic Vitamin B_1 deficiency is a frequent but often unrecognised cause of these conditions even in supposedly normal health it may be present but not suspected until the benefit from a higher Vitamin B_1 intake is observed

Clinical sample of Bemax and literature on request The Bemax Laboratories (Dept B 50), 23, Upper Mall, London, W 6

The TERRY CEILING MODEL Anglepoise LAMP

As good as a second right hand in the surgery

NOTE THE ANGLES

Yet another tremendous advance in surgery examination lamps—the Ceiling Model Terry Anglepoise Out of the way, yet instantly to hand at a touch, pouring its strong, penetrating concentrated beam *right on to the spot,* without any distracting glare in the user's eyes. Will practically reach to any part of the average surgery, thus avoiding awkward light shifting when the patient must not be moved Leaves both hands free. A perfect examining and dressing lamp For sheer efficiency and convenience nothing can simply approach the ANGLEPOISE—adjustable to 1,001 positions at a finger touch—and poised at any angle. Simply marvellous for all "close" work as it throws the clear light necessary for extreme accuracy It can be brought as close as required Saves on light bills—a 25 watt bulb works like a 60! Scientifically built—every part superlatively made. Chromium plated arms, tireless springs—for perfect balance In several models. Models for fixing to wall or table, and on smooth running castors 'A Triumph for Terry Springs.' From 50/- (U.K. only) Patented at Home and Abroad

HANGER ARTIFICIAL LIMB MAKERS ROEHAMPTON LONDON S W 15

★ for the PALE CHILD

A palatable, odourless, almost tasteless form of iron

In variable weather it is especially important to raise the tone and vigour of the pale child," by increasing the haemoglobin and red blood cell content of the blood Between the pressure of school work and play and the discomfort of changing temperatures, the anaemic child urgently needs blood recuperation and invigoration Only iron can do that but it must be in a form which a capricious child will take willingly

Ovoferrin meets the needs of the blood hungry child Palatable odourless and almost tasteless, children take Ovoferrin gladly whereas they rebel at the nauseating irritating organic salts Ovoferrin is noted as a rapid and certain builder of haemoglobin and red blood cells. It stimulates the jaded appetite, it does not constipate it does not stain the teeth, and it is retained by the most sensitive stomach. The dose for children is one or two teaspoonfuls in milk or water with meals. Each tablespoonful, the adult dose, contains one grain of easily assimilable metallic iron in colloidal form held in this state by means of a protective protein colloid Ovoferrin is prescribed in 11 ounce bottles Trial bottle on request.

"CERABAN" ADHESIVE SELF-SUPPORTING BANDAGE

The Supplementary or Alternative Treatment to Self Adhesive Elastic Bandages for

SPRAINS, DISLOCATIONS, CONTUSIONS, SWELLINGS, VARICOSE VEINS, VARICOSE ULCERS, ETC

Its use eliminates the risk of Dermatitis which so frequently arises from the application of Self adhesive Bandages

"CERABAN," whilst free from rubber possesses elastic properties and when carefully applied to the limb gives substantial support It is porous adhesive and non irritating will not chafe and permits of complete respiration of the skin

In the treatment of Varicose Ulcers the use of Ceraban Bandage eliminates the risk of Dermatitis which occasionally occurs through the application of self adhesive Elastic Bandages. In the less severe of such cases a distinguished authority writing in the *Lancet, page 580, Sept 7th, 1935, issue* recommends the use of Ceraban Bandage cut in strips as a first and protective dressing prior to covering with self adhesive Elastic Bandage and in the more serious cases the complete replacement by Ceraban It is waterproof antiseptic and being spread on an extensible material readily conforms to the shape of the limb and therefore will not slip

INFANTILE ECZEMA.

A quick cure—'would usually take months' writes doctor.

The doctor's letter

I happened to have in my consulting room a baby with eczema of the scalp which would normally have taken me months to cure.

I tried it with Sphagnol Ointment with most satisfactory results and am so pleased with the preparation that I should be grateful if you would forward me a pound package of it

Yours truly

——— M B

Reports of speedy cures with Sphagnol Ointment are not uncommon but the great virtue of Sphagnol Ointment is this—that from the first touch it is soothing cooling Used against eczema Sphagnol brings sure relief from itching and at the same time its healing peat principle helps the growth of clear healthy skin

Perhaps you have had no personal experience of Sphagnol Then the makers will gladly send you free samples

the scientific contraceptive

MIL-SAN is a bland non injurious spermicidal jelly independent of variable physiological conditions of moisture or temperature Since there is nothing to melt dissolve or foam MIL SAN is immediately effective

The formula of MIL SAN is based on biological principles in harmony with the natural chemical and bactericidal balance of the vagina Its spermicidal efficiency is due to (a) A low pH secured by the reinforcing action of several acids which ensures the immediate immobilization and death of spermatozoa despite the buffering action of the seminal fluid (b) A low surface tension which causes the jelly to spread rapidly and to penetrate the rugae of the vaginal and cervical mucous membrane (c) A degree of viscosity which ensures that it shall adhere to the cervix and upper vaginal tract and fornices, forming a chemical barrier preventing the penetration of spermatozoa into the os uteri

The method of applying the jelly is simple hygienic, and proof against carelessness Each application of 7 c c is contained in a specially made strong glass tube sealed at one end with a cork at the other by a hard wax plug In use the cork is removed, a bulb fitted behind the wax plug and the tube inserted Compression of the bulb forces the wax plug down the tube and ejects the contents The empty tube, which is thrown away proves the application and ensures the quantity There is nothing to fill, nothing to clean Each application is hygienic and complete

MIL SAN does not deteriorate and is not affected by climatic conditions

There are no contra indications to the use of MIL SAN with a dependable condom or a properly fitted occlusive pessary It is only by such combined use that the consequences of misuse of one or other of the methods can be minimized and the maximum practicable security obtained

MIL-SAN

Literature setting out the ingredients and full particulars together with a box of specimen tubes for examination, are sent on request to members of the medical profession

The problem of
SURGICAL STOCKINGS

Doctors who prescribe Compri Vena Stockings are sure that the most beneficial support is given as each one is made to the patient's measurements and needs They have long been recommended for Varicosity and in conjunction with Injection Treatment as well as during and after Pregnancy They are also invaluable in relieving undue leg strain. Compri-Vena Stockings are rubberless and yet elastic are washable, cool in wear and invisible under ordinary silk stockings They give real relief and preserve the shape of the legs A skilled staff carefully follow all doctors instructions Full details from

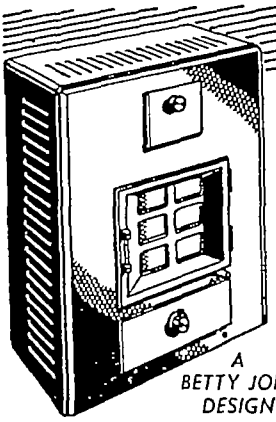
SALTAIR SURGICAL SERVICE

Guarantee
"We guarantee to alter exchange, or accept the return of any appliance without cost ordered by the Medical Profession if not found Suitable within fourteen days from date of supply"
Salt and Son Ltd.

THE SALTAIR ARTIFICIAL BREAST
AND BRASSIERE



This surgical fitment solves a problem peculiar to all cases of amputation of the breast So well does the Saltair Artificial Breast reproduce the normal and natural line of the bust that all cause for embarrassment is completely removed, and the patient is free to resume her social and other activities with the utmost confidence The Artificial Breast cannot slip out of position in any circumstances Made from finest resilient sponge rubber, covered with flesh silk to give a beautifully smooth surface Practically non-absorbent and so easily dried that bathing can be indulged in without fear Various sizes available, the average weight being only two ounces The Breast can be supplied without brassiere if the patient prefers to sew it into her own foundation garment Doctors are invited to write for the Special Pamphlet which describes The Saltair Artificial Breast at greater length

A little booklet with a big purpose

This booklet contains valuable information concerning the many useful functions of the crepe bandage in every day cases. Written by an eminent medical authority it is a handbook well worth possessing. The Norvic crepe bandage known and recommended for its remarkable elasticity which is arrived at by a special weaving process does not contain rubber in any form. It is given special mention in this interesting booklet. POST FREE on application to —

PISTANY MUD for *persistent* RHEUMATISM
Different from ordinary heat therapy

Why? Simultaneously with the physiological responses of the body to heat reactions are caused specifically by this hot sulphurous, radio active *living" mud A detailed* account of the analytical biological and clinical evidence appears in the September "British Journal of Physical Medicine"

How? It is easy and clean to apply The hot mud is wrapped in Cellophane" in which a window is cut to expose the mud surface to be laid on the skin This method entirely meets the conditions prevailing in clinics or homes, and costs very little to apply For demonstration phone LANgham 4214 *FULL INFORMATION FROM*

The Design of VALVE DEAF AIDS

The recent official Medical recommendations for valve hearing aids in preference to other types has produced a glut of these instruments varying little in appearance but much in performance. Anyone attempting to recommend which should be used has a difficult task unless he be experienced in this class of work

A glance at the accompanying photograph of the model C8 AMPLIVOX will show its supreme simplicity and strength Note the side contacts of nickel plated steel which never wear out, and which clean themselves as the battery is inserted The springs themselves are not fixed to the case There is not one connecting wire to be joined up

Now examine other valve deaf aids notice their flimsy construction and the press-on contacts which will give trouble in a month

AMPLIVOX reproduction is the standard by which other electrical hearing aids are judged If you are not convinced of the superiority of AMPLIVOX workmanship let us send you an instrument for comparison with any other

A copy of the Amplivox brochure describing all models and giving much interesting information on hearing aids will be sent on application

LONDON SCHOOL OF HYGIENE AND TROPICAL MEDICINE

INCORPORATING THE ROSS INSTITUTE.

POSTS OVERSEAS FOR MEDICAL MEN

A register is kept in the School of medical men who are prepared to be considered for posts overseas, and the School is frequently asked to advise plantation and mining companies when such posts fall vacant

The salaries offered are attractive conditions of service are governed by standardised forms of contract and many of the posts offer to medical men a most interesting field in which to practise their profession

It is desirable that candidates for posts overseas should hold a diploma in tropical medicine and hygiene The course provided by the London School for the Conjoint Board's Diploma lasts six months and the tuition fee is £40 The course may be taken from October to March or from January to June There are generally more vacancies in the course commencing in January

The Director of the Ross Institute is always glad to interview medical men who would like information regarding the possibilities of a career overseas if they will be good enough to make an appointment to call on him Enquiries may be addressed to

The Agency has made arrangements for special facilities on very favourable terms, to be afforded to approved purchasers for the advance of part of the premium for any suitable practice or partnership Full details on application

An Endocrine Prescription *in* Dysmenorrhea *and* Amenorrhea

You can write an endocrine prescription in one word — a proper combination of the endocrine principles which are now known to initiate and control the menstrual process. Your prescription will have the advantage of being filled with fresh potent endocrine constituents. The formula is in accord with the most recent research on the endocrine glands concerned in regulating menstruation.

Valentine's Meat-Juice

In the Gastric Form of Influenza and its Debility, in Typhoid and Acute Pneumonia, in the Exhaustion of Phthisis and Pulmonary Diseases, Valentine's Meat-Juice Sustains and Strengthens.

When Other Food Fails

THE quickness and power with which VALENTINE'S MEAT-JUICE acts, the manner in which it adapts itself to and quiets the irritable stomach, its agreeable taste, ease of administration and entire assimilation recommend it to physician and patient.

Physicians are invited to send for brochures containing clinical reports

For sale by European and American Chemists and Druggists

Does "Old Established" cut any ice?

In other words, does the fact that we have been making this tobacco for the last forty years prove anything? Frankly, left at that, we don't think it does But when we also state the fact that, during these forty years, a steadily increasing army of smokers has come to swear by WILLS's Cut Golden Bar, it surely proves there's *something* pretty remarkable about it. Its price of 1/- an ounce, we think you'll agree, is scarcely enough to explain its popularity—there are so *many* cheaper brands nowadays *You can get it in the Original form or Ready Rubbed*

Yes, and all relying on the battery for their source of supply More and more new accessories, and components, together with many previously operated mechanically or automatically, impose such a drain on the battery that most motorists are faced with two alternatives—to lay up the car periodically while the battery is fully recharged, or to charge overnight at home—preferably with a Westric.

'Gas fires kill draughts but cure stuffiness' says

Mr. THERM (of Harley Street)

If you were to go into a room fitted with a modern gas fire, fill it with smoke, and then light the fire, you would see the smoke being gently but firmly sucked up the flue In about twenty minutes the room would be clear!

A modern gas fire changes the air in a room three or four times every hour 'It does so quietly and unobtrusively, creating no uncomfortable draughts Stuffiness is equally impossible That is because the modern gas fire emits an unusually large proportion of the shorter infra-red rays which warm the room (and its occupants) without drying or overheating the air

THE PRACTITIONER

Founded in the  *Year* 1868

EDITORS
Sir Humphry Rolleston, Bt, G C V O, K C B, M D F R C P.
and Alan A Moncrieff, M D F R C P

The Editors of *The Practitioner* have prepared the following programme of practical numbers dealing with Treatment

DECEMBER, 1937

THE SULPHANILAMIDE DRUGS

This symposium describes the history and development of prontosil and allied substances—their use in general practice and in obstetrics—the nomenclature of the various preparations on the market with the correct dosage A questionnaire on puerperal sepsis is included which every practitioner is asked to complete as soon as possible Price 4s

JANUARY, 1938

THE USE OF ENDOCRINES IN TREATMENT

This practical number describes the use of thyroid, parathyroid and pituitary preparations, of adrenal hormones, and of the male and female sex hormones It also contains an article on diet in obesity and endocrine disorders Price 4s

FEBRUARY, 1938.

DISORDERS OF DIGESTION

The subjects in this symposium include two articles on abdominal pain and others on the significance and treatment of indigestion, vomiting, constipation, diarrhoea and obstinate hiccough and on laboratory aids in the diagnosis of gastro-intestinal diseases Price 4s

The March Number will contain a symposium on

ANAESTHETICS IN GENERAL PRACTICE

A Special Number on an important subject will be published in the Spring Each issue throughout 1938 will contain an article in the series on "Diet in Health and Disease"

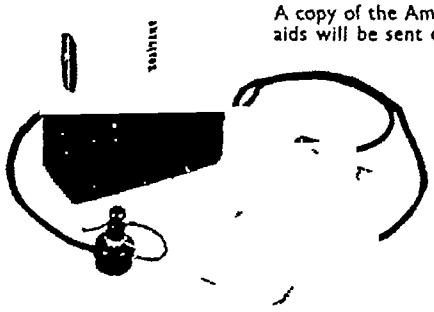
The New Pocket AMPLIVOX a VALVE DEAF AID to Wear on the Person



The disadvantages of the ordinary micro-telephone hearing aid are well known to every user of a deaf aid, and to most members of the Medical Profession In very few cases can they be tolerated, but where an instrument has been needed for personal wear there has been no alternative available, owing to the size and weight of valve aids

In the new 'Pocket' AMPLIVOX size has been reduced to a minimum consistent with reasonable battery life and sufficient amplification (No AMPLIVOX instrument has a maximum amplification less than 50 decibels)

The crystal microphone and 3 stages of valve amplification are contained in a box which can be slipped into the waistcoat pocket, slung from the lapel, or carried by a cord around the neck The battery box is small enough to go into a jacket pocket or can be carried in a lady's handbag The frequency response is 50/6 000 c.p.s

The 'Pocket' AMPLIVOX can be recommended in all cases where a valve aid is indicated and where it is essential that it be as readily wearable as possible

A copy of the Amplivox brochure describing all models and giving much interesting information on hearing aids will be sent on application

BUIE'S PROCTOLOGY

A NEW BOOK

Just Off Press! This *entirely new* book by Dr Louis A Buie is all that its name implies It is indeed *Practical Proctology*'—clear concise, a record of *clinical* experience Furthermore this book was planned and written with specific consideration for the needs of the General Practitioner as well as those of the Proctologist Surgeon Gastro-enterologist and Internist *It is both medical and surgical*

Dr Buie has given particular attention to those diseases and conditions of most frequent occurrence in practice There are 63 *pages on Haemorrhoids and Rectal Prolapse including the injection treatment* for use in surgery or hospital as well as operative technique There is a 34 *page discussion of Anal Pruritus* with the author's own method of treatment that has proved successful in 92 per cent of the cases treated *Chronic Ulcerative Colitis* is taken up with full consideration for diagnosis and treatment including 6 colour illustrations of the progressive stages It is only necessary to compare the bowel with these pictures in order to make the diagnosis

Dr Buie indicates clearly when proctoscopic examination should be undertaken describes the necessary preliminaries then gives you the entire technique The details of pre-operative preparation and post operative care are precisely given including the use of the various types of anaesthesia position of the patient exposure of the field etc. Throughout his book Dr Buie describes *both operative technique and non operative measures* in step by step detail and clarifies his statements with many vivid illustrations

CONTENTS of this NEW BOOK

DEAN'S ARE THE MANUFACTURERS OF THE X-RAY APPARATUS THAT CONTINUES TO GIVE ACCURATE SERVICE

Many of the leading hospitals have Dean apparatus installed in the X-Ray department, hundreds of practitioners rely on Dean apparatus, numerous clinics make Dean Units their choice, and each week we receive letters of appreciation telling of the satisfactory results obtained with our apparatus

The wide variety of design and sizes of our units makes it possible for us to supply the needs of every class of X-Ray department, whether large or small Every likely situation has been carefully studied —one of our most popular units being the mobile type which enables the apparatus to be moved to the patient's bedside

Will you forward your professional card? —we *know* you will be interested in our illustrated descriptive literature

WHAT IS "SERVICE" ?

The Service Centre for all Medical and Surgical Supplies

A DOCTOR S service to his patients is the greatest service in our life Some of us may have an opportunity of service to humanity of more than usual importance once or twice in our entire lives, and when this opportunity occurs we can be justly grateful

It is difficult for laymen to realise that the doctor s entire life is devoted to the service of humanity From the beginning to the end, his discharge of this service is an everyday occurrence

We who are close to the doctor in his work are given a better opportunity than most to realise that no ordinary mortal could accept —or discharge—the great responsibilities that are his normal burden

There are no short-cuts to acceptance in the field of medicine Self-praise is odious and none realise better than ourselves how much we owe to the searching criticism and constructive comments of the doctor Without these, Baxter s Intravenous Solutions (developed and manufactured by Doctors) could not have reached the standard of perfection they have

We are proud and grateful in the knowledge that in a comparatively short space of ten years Baxter Vacoliter Solutions have become the standard in over 6,000 Hospitals throughout the world, including many Educational Institutions and Clinics In eleven short months the endorsement of Baxter Vacoliter Solutions by the doctors of Great Britain has impressed us so deeply that we feel urged to write this expression of our appreciation and to affirm our intention of keeping faith

Baxter Vacoliter Solutions are safe, whether used a day or years after manufacture In the four Baxter Laboratories—devoted exclusively to the preparation of Intravenous Solutions—nothing is left to chance Each batch of Solutions must pass rigid tests These tests include a more than adequate biological check, complete bacterial yeast and mould tests at incubator and room temperatures, chemical assay, pH value, visual inspection with special light-detecting equipment

As a further safeguard, the Solutions are periodically checked by the Bland-Sutton Institute

PROSTATIC ENLARGEMENT

& URINARY DISORDERS OF PROSTATIC ORIGIN

Urinary retention is due in the first place, to the enlargement of the gland but both the congestive and spasmodic factors must be taken into consideration as they, in themselves can cause as much obstruction as the simple enlargement

The progress of adenomatous enlargement is slow yet the symptoms of urinary disorder frequency, difficulty and retention show no constant relationship between the increase in the size of the gland and the phenomena of retention

SEDOPROSTYL is a preparation which embraces all three causes of obstruction and the many excellent results now placed to the credit of SEDOPROSTYL have amply repaid the work of those Urologists who devised the formula

Proved efficiency with *pleasantness*

In spite of its high germicidal efficiency (Rideal-Walker 3 0) 'Dettol' can be used at strengths impracticable with carbolic and cresylic antiseptics. It is non-poisonous, non-staining, pleasant smelling It has been shown that when 30% 'Dettol' is rubbed into the hands and allowed to dry the skin remains insusceptible to infection by haemolytic streptococci for at least two hours, unless grossly contaminated 'Dettol' is also stable in the presence of blood, pus, faeces and other organic matter

Obtainable from chemists in 1/-, 1/9 and 3/- bottles, and in larger sizes for medical and hospital use These prices do not apply in the Irish Free State and Overseas Samples and full information on request

ALASIL

Better Salicylate Therapy

WHATEVER be the season of the year there is a wide sphere of utility for Alasil the improved form of salicylate medication

Alasil is a very definite advance on ordinary compounds of salicylic or acetyl salicylic acid both in therapeutic efficiency and in freedom from the risk of unpleasant gastro intestinal sequelae. This high tolerability is due to the fact that "Alasil is composed of calcium acetyl salicylate—the least irritating of the salicylate compounds—and Alocol (Colloidal Hydroxide of Aluminium) a powerful gastric sedative and antacid.

A careful series of experimental tests has shown that Alasil is more completely absorbed than ordinary salicylate compounds and that it is practically free from the risk of liberating free salicylic acid in the stomach

Wide clinical experience anticipated these findings by demonstrating that Alasil" can be pushed or prolonged to a much greater extent than ordinary salicylate compounds and that it can be given with safety to children adults, the aged and patients with finely balanced digestive capacities An analgesic antipyretic and sedative of established value

A supply for clinical trial with full descriptive literature sent free on request

Cystopurin

The ideal urinary antiseptic for oral administration!

1 Produces no gastric irritation or toxic symptoms

2 Is readily absorbed from the gut and excreted in the urine

3 Causes no renal irritation

4 Renders the urine bactericidal in low concentrations

5 Acts from the renal pelvis downwards

6 Is active in either acid or alkaline urine

7 Perfectly safe for use in febrile conditions

8 Acts on all causative organisms of urinary infections

HAEMATURIA

From information received —

"I had a patient suffering from hæmaturia following influenza I treated him with Cystopurin, and the condition cleared up almost like magic"

I had a patient with severe hæmaturia which I put down to calculi in the bladder I at first considered the idea of sending him to hospital and having the stone removed as he was getting very weak through loss of blood Then I put him on Cystopurin, and found almost immediately relief The symptom gradually subsided and he is now quite well The one great advantage in it, above all other drugs, is that IT CAN BE USED WHETHER URINE IS ACID OR ALKALINE"

"I have used Cystopurin in a case of hæmaturia and the patient having derived so much benefit, is now using it regularly"

I administered Cystopurin in a case of hæmaturia and B coli infection in a male aged 63 years Micturition was painful, scalding scanty and frequent pulse 108 and temperature spiky being highest in the evening This was a case where a chronic cystitis had lighted up again and the bladder wall had thickened, some of the trouble being due to prostate I gave six Cystopurin tablets in 24 hours during the first week then three and after 14 days treatment, pulse and temperature became normal and patient looked very much better"

Supplied in bulk and in tubes of 20 tablets for dispensing purposes.

Samples and literature available on request to

GENATOSAN LIMITED, Loughborough, Leicestershire.

MARMITE (YEAST EXTRACT)

IN PREVENTIVE MEDICINE

Susceptibility to infection is known to be minimised by correct nutrition

It is particularly important to ensure that ample supplies of the vitamin B complex are taken, as deficiency of these factors is not uncommon, and may be responsible for a considerable amount of preventable illness

Marmite contains all the vitamins of the B group and has proved of undoubted value in preventive and curative medicine

BRAN

the safest method of remedying the deficiencies of

BULK

in modern diet

7½D Per Packet

CHRONIC **CONSTIPATION** YIELDS TO **BRAN** REMEDY

The problem of balancing up the lack of bulk in diet and so ensuring normal bowel action is one which is solved by the addition of Kellogg's ALL-BRAN to the diet ALL-BRAN is a natural laxative food and is rich in Vitamin B and iron.

ALL-BRAN cleanses like a *water-softened sponge* Within the body the soft "bulk" of ALL-BRAN gently exercises intestinal muscles, and *sponges out the system ensuring natural and regular elimination* Some patients eat Kellogg's ALL-BRAN, served *from the packet*, with cream or milk Others prefer it cooked into biscuits, cakes or omelettes

Except in cases of hyper-sensitive digestive tracts, Kellogg's ALL-BRAN can be safely and confidently prescribed Full-sized sample packet free on request.

MANDECAL

(Compound Calcium Mandelate B D H)

The advent of Mandecal marks a distinct advance in the evolution of mandelic acid treatment of urinary infections, indeed, the administration of Mandecal approaches the ideal method of practising mandelic therapy Hitherto Mandelix (Elixir of Ammonium Mandelate B D H) held pride of place by reason of its simplicity in use and of the dependability of its therapeutic effects Its administration, in the majority of cases, produces a sterile urine within a week, the pH of the urine being maintained at the correct level without the administration of ammonium chloride

Furthermore, Mandelix is acceptable to the vast majority of patients, but there are a few, particularly those suffering from chronic infections, who are nauseated by the prolonged treatment necessary in such cases Mandecal meets the needs of these special patients, at the same time it yields dependable therapeutic effects equal to those achieved with Mandelix

Mandecal is a special preparation of pure calcium mandelate, it is readily miscible with water and is exceedingly simple of administration It is available in the form of a pleasantly-flavoured powder, in bottles containing sufficient for treatment lasting seven days

The Product of Unique Experience

The gas combustion furnace shown here is the actual piece of equipment with which the correct formula of Adrenalin was determined in 1901 in the Parke Davis Research Laboratories

ADRENALIN

(P. D & Co)

PARKE, DAVIS & CO introduced Adrenalin to the medical profession in 1901 During the thirty-six years that have elapsed, they have manufactured it continuously, and their long experience enables them to offer a natural product that is unsurpassed in effectiveness and purity

Adrenalin (P, D & Co)—the original and well-tried preparation—is extracted from the medullary portion of selected adrenal glands The isolated substance is then standardized by both physiological and chemical methods to secure full activity of the finished preparation

Medical men can make sure of obtaining Adrenalin products that are potent, uniform in action, and reliable by specifying "P, D & Co"

Full particulars of Adrenalin (P., D & Co) and its uses will be supplied on request.

MORE THAN 200 PUBLISHED REFERENCES

During the six years since its introduction, Nembutal has been the subject of more than two hundred reports and references in medical literature. This record is important not only as an indication of the profession's interest but also as evidence of the extensive clinical investigation to which the drug has been subjected • Today, its uses and advantages as well as its limitations are well understood and the practitioner can make use of Nembutal with full confidence in its safety when administered as recommended • Used orally rectally or in emergencies, intravenously Nembutal exerts an extremely rapid but brief hypnotic and a pronounced sedative action from a dosage only about one half that of most other powerful barbiturates This small dosage by lessening the amount of the drug to be eliminated makes Nembutal clinically one of the safest of the barbiturates • Safety rapidity and brevity of action recommend Nembutal for use as a pre-anæsthetic sedative in both major and minor surgery, as well as for the treatment of insomnia hysteria sea sickness nausea from any cause, eclampsia delirium tremens convulsions from strychnine or other poisoning as a supplement to morphine in controlling the pain of early cancer and in obstetrics • Nembutal is available in a wide variety of forms the most widely employed of which are the ½-grain and 1½-grain capsules for oral administration Comprehensive literature together with a free trial sample of the 1½-grain Nembutal capsules will be sent upon request

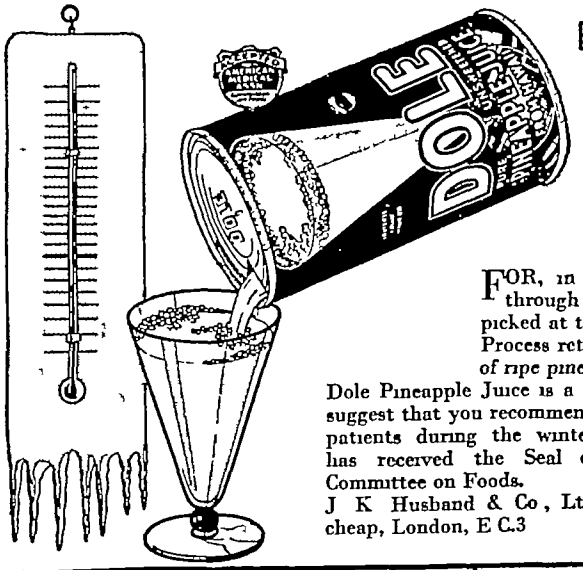
FOR EFFECTIVE AND SAFE

ANALGESIA

To the patient's plea for something to relieve headache, neuralgia, sciatica, lumbago, the pains of myalgia and arthritis, or the periodic suffering of women, there is no more effective answer than a prescription for VEGANIN A trial of this synergistic combination of acetylsalicylic acid, phenacetin and codeine will demonstrate its analgesic superiority over that of the individual drugs administered separately Moreover, with Veganin, there is no systemic disturbance, no habituation, it is perfectly safe in the patient's hands



Veganin Brand Tablets are supplied to the public in tubes of 10 and 20 boxes of 100 500 and 1 000 for surgery use

Even in the midst of December you can recommend

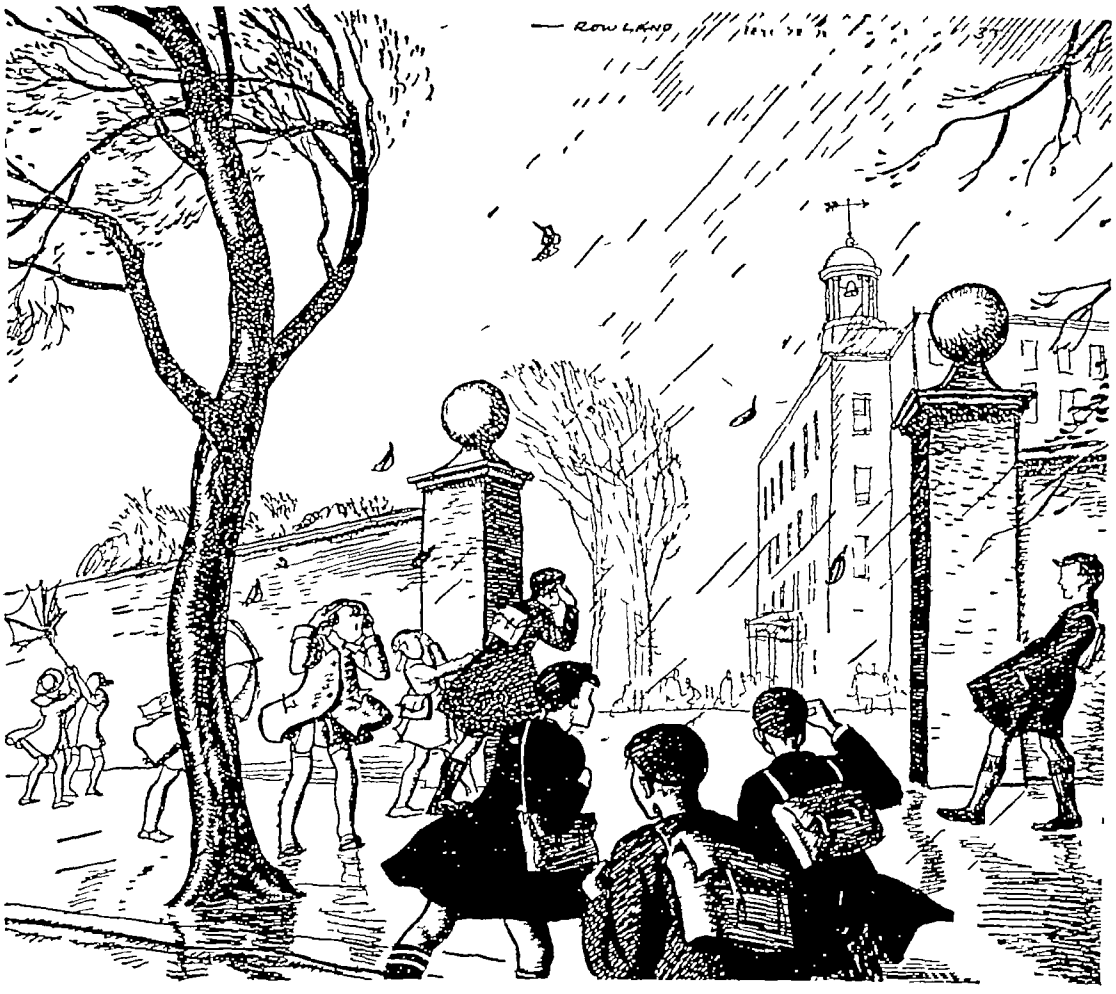
THIS GOLDEN JUICE OF "SUMMER"

FOR, in Hawaii, it is always summertime. The sky is blue, and through warm tropic days pineapples slowly ripen, until they are picked at the peak of perfection. The Dole Fast Seal Vacuum Packing Process retains to a high degree the important fresh fruit constituents of ripe pineapple.

Dole Pineapple Juice is a natural source of vitamins A, B, and C. That is why we suggest that you recommend with entire confidence this fine natural fruit juice to your patients during the winter months. It is the original pineapple juice And it has received the Seal of Acceptance of the American Medical Association's Committee on Foods.

J K Husband & Co, Ltd., 10 Eastcheap, London, E C.3

Here is a typical analysis of Dole Pineapple Juice:



Moisture	85 3%
Ash	0.4
Fat (ether extract)	0 3
Protein (N × 6.25)	0.3
Crude fibre	0 02
Titratable acidity as citric acid	0 9
Reducing sugars as invert sugar	12.4
Carbohydrates other than sugars (by difference)	0.38

P.S. Write to us on your letterhead and we shall be glad to send you a sample tin free of Dole Hawaiian Pineapple Juice.

COCONUT TREE CLIMBER—This native lad is climbing a Honolulu skyscraper with the greatest of ease He is after the green coconuts and the cool refreshing milk therein.

The malihini (newcomer to the Islands) always gets a thrill watching the native boys scamper up the tall palms Not infrequently young tourists attempt to imitate the tree-walkers, sometimes with painful results.

A valuable supplement to the normal

'PROTECTIVE' FOODS

BOURN-VITA *Induces* SOUND, RESTORING SLEEP

As an aid to sleep Bourn vita has been proved remarkably successful For Bourn vita brings the deep sleep that gives complete relaxation to nerves, mind and body, and builds up new life and energy for tomorrow

Many Practitioners are finding Bourn-vita invaluable as an 'all-in-one' protective food in cases of vitamin deficiency And although the principal protective foods —milk, eggs, fresh fruit, vegetables—are present in most normal diets, most doctors agree that an *additional* supply is distinctly beneficial

Bourn-vita contains the vitamins A, B and D, also calcium, phosphorus, iron and other valuable mineral salts Scientific production in quantity enables Cadbury's to sell Bourn-vita at the very low price of 9d per ¼lb

CADBURY'S

BOURN-VITA ¼lb 9D ½lb 1/5 1lb 2/9

THE PROTECTIVE FOOD

ANDREWS LIVER SALT

combines the laxative action of

MAGNESIUM SULPHATE

with the pleasing qualities of an

EFFERVESCING SALINE

1 ANDREWS LIVER SALT is a pleasant-tasting effervescent aperient with tonic properties Its laxative action is due to the presence of magnesium sulphate and other salts, which, by their Osmotic action, induce the flow of water through the bowel wall from the surrounding tissues In this way, the walls of the bowel are thoroughly cleansed, and its contents are maintained in a semi-fluid condition, thus ensuring an easy painless evacuation.

2 By removing from the system the poisonous waste food substances, which slow down the digestive process and impede the action of the liver, ANDREWS acts as a tonic to the whole system and is a valuable aid in maintaining perfect fitness

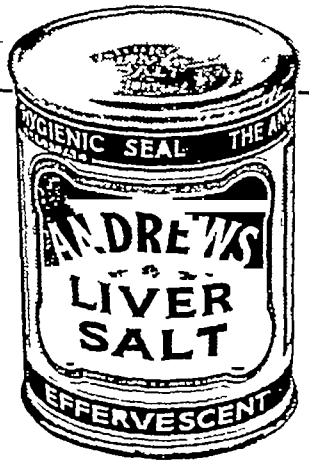
3 ANDREWS stimulates the flow of bile, and thus assists in the later stages of food assimilation and in destroying the toxins of faecal stagnation.

4 It is ant-acid in action, and the carbon dioxide which is liberated when ANDREWS is dissolved in water has a sedative effect on the stomach and a physical cleansing action on the stomach walls It is, therefore, valuable in cases of indigestion, sickness and sick headaches

5 Rheumatism, when due to bowel sepsis, may be safely treated with ANDREWS LIVER SALT and the treatment of all forms of this disease is assisted by the effective bowel evacuation induced by ANDREWS

6 It relieves headaches caused by excessive intercranial pressure, by reducing the amount of fluid passing through the brain.

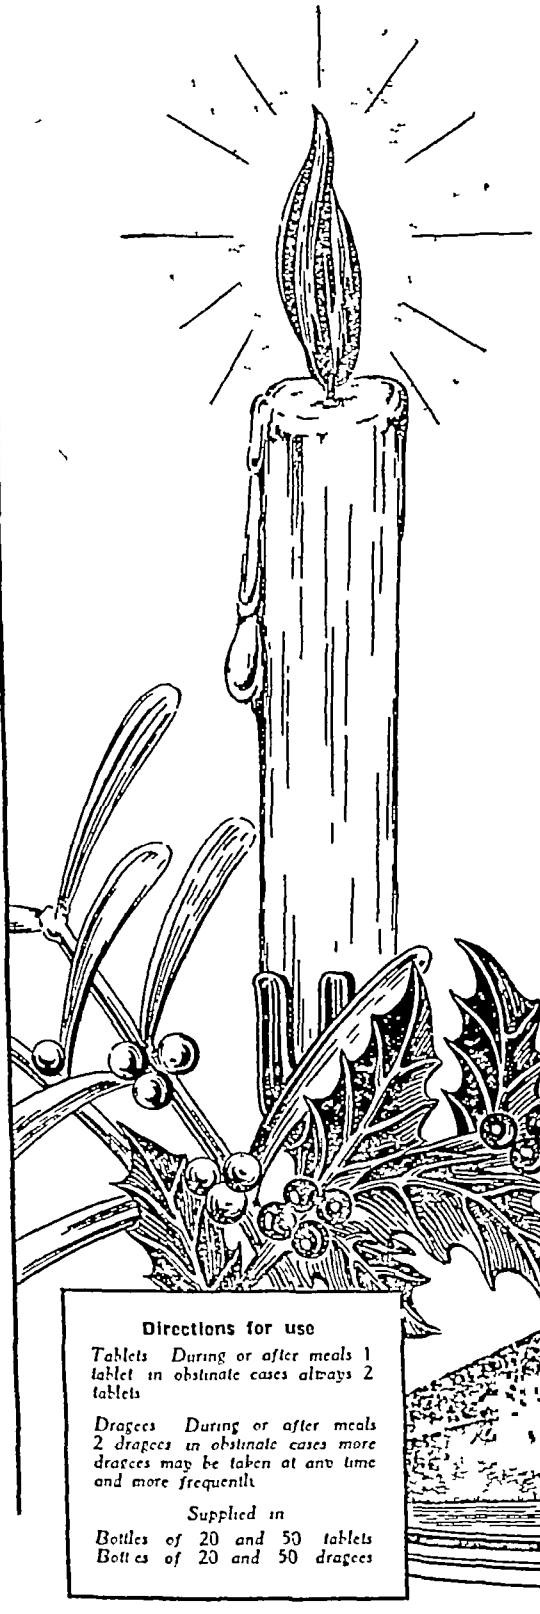
7 It may be used as a hydragogue purgative in the treatment of oedema, ascites, pleuritic effusions, and nephritis, and with safety even in failing cardiac conditions



8 In cases of fever, its brisk effervescing solution in water makes a refreshing and invigorating drink, quenching thirst, diluting the toxins, and relieving the strain upon the kidneys

9 It is useful in pharyngites and post nasal catarrh, dissolving secretion in the throat and clearing the stomach of discharges that have been swallowed.

10 It may be taken with perfect safety by the most delicate adult or child, and may be confidently used in pregnancy where the stronger purgatives might be harmful ANDREWS does not produce any violent disturbance in the system, nor does it affect the secretion of milk.



DOSE—as a laxative the usual dose is two teaspoonfuls stirred into a glass of water and taken on rising in the morning or last thing at night, but this should be adjusted to individual needs and, in the case of children graduated according to age.

A NEW FEATURE
Each tin of Andrews is now sealed by a patented damp-and dust proof Cellophane Cap, which maintains original Laboratory condition making a good product even better

An 8-oz Tin will be sent free, on request, to any member of the Medical Profession.

Recent Authoritative Opinions

IN conditions where fatigue or depression is a factor, 'Benzedrine' Brand Tablets are finding an extensive field of usefulness The question of safety is, therefore, a point of paramount importance Three recent findings are especially pertinent in this connexion —

1 My experience supports the experience of others that benzedrine sulfate when used in the proper manner has no apparent permanent deleterious action All ill effects noted thus far have been largely of minor character and only temporary There is no evidence of habit formation

New Eng Jour Med, 217 696 1937

2 Repeated sublethal doses of 'Benzedrine' were injected into rats without producing detectable lesions Transferring the findings to man on a weight basis the authors conclude that there should be a considerable margin of safety in the proper therapeutic use of Benzedrine Brand Tablets

Ann Int Med 10 1874 1937

3 "From the evidence which has so far accumulated, 'Benzedrine' does not appear to be toxic in usual doses nor does it seem to be habit forming'

Jour Amer Med Assoc., 109 549 1937

Obviously, however, the nature of 'Benzedrine' Brand Tablets is such that their use should be closely supervised by the physician A sample, together with the latest literature, will be sent to any qualified practitioner on request

Each tablet contains 5 mg β-Phenylisopropylamine Sulphate (Isomyn Sulphate)

SUPREME QUALITY IS BURROUGHS WELLCOME QUALITY

Adenitis—This term was restricted to the cases in which the degree of enlargement was greater than that which commonly accompanies the angina at the beginning of scarlet fever This of course is a personal standard dictated by previous experience but most of the cases had some pain tenderness or pyrexia.

Secondary Tonsillitis—Any tonsillitis occurring after the initial inflammation of the throat had subsided

Albuminuria—The febrile albuminuria of the initial stages, the albuminuria of serum sickness and any transient albuminuria lasting for less than twenty four hours were not included

Nephritis—The presence of blood albumin or casts in the urine together with the usual signs and symptoms of acute nephritis.

Relapse—As every case in the series was definitely one of scarlet fever no question of the recorded cases of relapse being anything other than a true relapse can arise

Discussion

It will be seen from Table I that in the series under consideration para benzylaminobenzenesulphonamide has no significant effect upon either the duration of the initial pyrexia or the incidence of complications When comparing clinically the duration of the toxic symptoms in the patients there was a difference between Group I on the one hand and Groups II and III on the other The last two groups appeared to show rapid improvement which can probably be attributed to the antitoxin administered There was however no obvious difference between Groups II and III indicating that the sulphonamide had no appreciable effect upon the toxaemia Although the serum rapidly produced some fall in the temperature, no change was observed in the total duration of the initial pyrexia as judged by the standards set out above

Several factors may account for this rather disappointing result of the administration of the sulphonamide The first that naturally arises is the possibility that the substance used is ineffective However Peters and Havard (1937) have published a series showing a marked reduction in the number of cases having complications when treated with para benzylaminobenzenesulphonamide, which seems to show that this substance is active Another possibility is that the dosage employed was inadequate At the beginning of the investigation there were few available records of its use in mild conditions such as scarlet fever, and it was necessary to proceed cautiously Later as mentioned below larger doses were used but without obvious improvement in the results With both the smaller and the larger doses mild toxic features in the form of a roseoliform rash were observed Colebrooke and Kenny (1937) found that prontosil had little or no effect upon infections caused by haemolytic streptococci of low mouse virulence This finding was confirmed by Long and Bliss (1937) but not by Mellon Gross and Cooper (1937) who stated that the sulphonamide was equally effective against haemolytic streptococci of medium and high virulence

It has already been pointed out that the average severity of the cases under consideration was low and a study of Table II will show that very few cases come under the term moderate to severe It is possible that the para benzylaminobenzenesulphonamide might have had a greater effect in a group of more severe cases This tends to be borne out by the series of Peters and Havard (1937) which shows a remarkably high percentage of complications in both the treated and untreated cases A reasonable deduction to be made from this is that the haemolytic streptococcus involved in their cases was of a more virulent type than that involved in the present series

'Elastoplast' in the treatment of displaced Semilunar Cartilage

Various methods of applying 'Elastoplast' have proved successful, and are described in "Elastoplast Technique" The method illustrated leaves the back of the knee entirely uncovered yet provides excellent support For this purpose a one yard by three inch strip of plain 'Elastoplast' Bandage is cut down the middle leaving about six inches uncut. The uncut end is applied to the side of the knee, then over the patella and then bandaged with the strips above and below, each layer overlapping the previous layer The length of the strip can, of course, be varied—depending upon the amount of support required, and, if necessary, full width strips may be applied

A copy of "Elastoplast Technique" will be sent on request

and those authors were able to show a substantial reduction in the number which developed complications Confirmation of the efficacy of the particular drug employed was obtained from its beneficial effects in another condition caused by the haemolytic streptococcus treated in this hospital—namely, erysipelas It is also reported by many workers that prontosil is not active towards certain strains of haemolytic streptococci This may have some bearing upon the present findings

In order to study the effect of larger doses the following amounts of para-benzylaminobenzenesulphonamide are being given in a further series of cases of scarlet fever Cases under 5 years of age, 1 gramme thrice daily for seven days, then 0 5 gramme thrice daily for seven days Cases over 5 years of age, 1 gramme four times daily for seven days, then 0 5 gramme four times daily for seven days So far twenty-two cases have been treated, with the following results Five cases have developed complications (rhinitis 1, adenitis 1, relapse 2, impetigo 1), and there have been two cases of toxic erythema Although the number is small there is no reduction in the incidence of complications

Summary

In a series of strictly controlled cases of scarlet fever during the period July, 1936, to May, 1937, the administration of para-benzylaminobenzenesulphonamide was found to have no significant effect upon the duration of the initial pyrexia, the initial toxaemia, or the incidence of complications Various reasons for this finding are advanced I personally incline to the belief that a combination of three factors is responsible—namely, the mildness of the disease, the fact that a haemolytic streptococcus which is not affected by the sulphonamides, or only slightly affected, was the causative organism, and that while it is less toxic the para-benzylaminobenzenesulphonamide is also less active than its companion reduction products

I wish to acknowledge my indebtedness to Dr M Mitman superintendent of the Eastern Hospital, at whose instigation this work was started, for his kindness in allowing me to publish the findings

THE OCCURRENCE OF SUBCLINICAL TRICHINOSIS IN BRITAIN

RESULTS FROM 200 LONDON NECROPSIES

BY

VERNON D. VAN SOMEREN, B Sc

Research Student Department of Helminthology London School of Hygiene and Tropical Medicine

Recent work in America (summarized and extended by Hall and Collins, 1937) has shown that the population of the United States has a high incidence of unsuspected trichinosis, about 12 to 13 per cent of over a thousand cadavers examined post mortem being infected with encysted trichinella larvae In not one case had trichinosis been diagnosed during life, despite the fact that several of the cases showed an infection of up to 1,000 larvae per gramme of muscle The aetiology of trichinosis in the United States has been discussed by Hall (1937a), who has stated that this high incidence of human trichinosis is almost certainly due to the practice of insanitary methods of pig-rearing such as garbage- and swill-feeding, trichinous pork scraps from trimming plants and table refuse being re-fed to pigs, thus maintaining a high percentage of infection among the animals Only a small proportion of such pig meat is ever examined by Federal inspectors, and the consequent degree of exposure to infection of the population is thus dangerously high Grain-fed swine show a very low incidence of infection, and the part which rats play in the transmission of the disease is small, trichinosis being transmitted direct from pig to pig in trichinous garbage

Previous Records of Trichinosis in Great Britain

In spite of rigid meat inspection trichinosis still persists in Germany and Denmark, but the scarcity of records of trichinosis in Great Britain suggests that the disease is uncommon in this country Apart from the original specimens discovered by Peacock, Hilton, and Paget and described by Owen and Farre, trichinae have been found post mortem in the following instances in Great Britain, trichinosis having been unrecognized during life The clinical history of the Wood (1835) case in Bristol Infirmary, however, shows the typical symptoms of trichinosis—acute rheumatic pains, dyspnoea, and pericardiac inflammation—the patient finally succumbing to pneumonia The probable cause of these symptoms was not discovered until after death, but even then the true relation of the encysted trichinae to the clinical picture was not fully realized Two cases occurred at about the same period in the London Hospital (Curling, 1835–6), in both of these the cysts were very numerous, but the disease was unrecognized and not fatal, death being due in one case to a fractured skull and in the other to an aneurysm of the aorta Topham (1850) describes a case occurring in medical practice in Wolverhampton the cause of death being diphtheria The trichina cysts were well calcified, with a mass of granular matter lying near the larvae, indicating an infection of long standing No clinical history of trichinosis had been recorded, and the source of infection was unknown

Bellingham (1852), in his account of a case in Dublin, says that the patient had had oppression of breathing for several years, and the post-mortem examination revealed emphysema of the lungs and pus in the pleural cavities The superficial muscles of the chest and neck were

AUTOPHYTIC DERMATITIS*

BY

HENRY MacCORMAC, C.B.E., M.D., F.R.C.P.

Physician for Diseases of the Skin Middlesex Hospital

Autophytic dermatitis is, I am confident, far from uncommon, and is therefore a subject worthy of discussion. Its true nature may not be recognized for months or even years, and in its various forms—for they are many and diverse—it *can deceive every class of practitioner, including* dermatologists. Self-inflicted skin disease is by no means a modern phenomenon, although it would seem that the strain and increasing effort which characterize present conditions have very clearly increased its incidence. Indeed, its features were until a comparatively recent date in certain forms at least, either not understood or in dispute, for we find as late as 1903 Radcliffe Crocker insisting that in so-called hysterical gangrene the theory of self-infliction was the most obvious explanation.

Types of Eruption

The number of recorded cases of self-inflicted injury to the skin now forms a considerable literature; an examination of these records and of those coming under my personal observation shows that while the eruptive processes and the mechanism of their production are, broadly speaking, similar, the individuals who resort to these deceptions are of different patterns, falling into groups which can be distinguished and separated. Since the term autophytic dermatitis covers all these groups it is first necessary to examine the various forms of eruption met with and their characteristics. First, it is quite clear that no one can reproduce the lesions of diseases such as psoriasis or lichen planus. On the other hand it is not difficult to cause by external agents inflammatory reactions of different degree varying from simple erythema to ulceration, blistering or even deep necrosis with subsequent scar formation. Such reactions may mimic various infections of the skin staphylococcal or streptococcal especially when secondary sepsis occurs or the granulomata of tuberculosis or syphilis. If the formation of bullae distinguishes the eruptions a diagnosis of pemphigus or dermatitis herpetiformis may appear to satisfy the conditions, and the frequent reference to hysterical pemphigus in the older textbooks emphasizes the antiquity of this deception. The ingenuity of this class of individual extends beyond such simple expedients; they are known to have clipped out pieces of skin with scissors, to have used pigments and iodine with remarkable results, to have pulled out or cut the hair, accounting for the strange epidemics of alopecia areata observed in schools, and in an extraordinary case recorded by Sir John Collie (1910) a young lady for many months produced typical eczematous eruptions by rubbing the skin with pumice stone. Her case was further complicated by gastric pain, vomiting of blood, and at a later date the symptoms of obstruction of the bowels.

The guiding characteristic of all these artefacts lies in their want of a perfect and, indeed, often of even an approximate reproduction of a genuine disorder. They tend to appear on the left side of the body, especially on *the arm and leg*; this applies to right-handed individuals, and the reverse is equally true. Further, all the lesions are within reach of the hand. One exception to this rule has come under my observation in a patient who presented a large number of round pigmented disks all of the size of a halfpenny scattered over the back and front of the chest. That they were artificially produced was certain as the man was in receipt of benefit because of the eruption; one assumed a conspiracy between him and his wife. In other cases the artificial nature of the eruption is disclosed by a straight edge or an abrupt angle, neither of which is observed in genuine dermatoses. Again, an irritant liquid carelessly applied will trickle down the skin—valuable evidence when present. These types and others where the hysterical patient indulges her fancy in lines or stripes, some along the limb, others across it, or where the eruption is fantastically bizarre present no real difficulty in diagnosis. There are times however, when everyone is puzzled and where suspicion is only confirmed after the most careful observation. For example, in many young women with the so-called hysterical eruptions some form of injury or disease has directed the patient's attention to the skin, and the subsequent and self-inflicted lesions may all appear to be a natural sequence.

Even more difficult to assess are those cases where an eczematous eruption is present, especially in alleged industrial dermatitis. When we remember the injurious effects of simple soap and water upon genuine idiopathic eczema we can see how easily a patient with dermatitis, whether it be of occupational origin or not, can aggravate and extend the condition at his or her will by mere friction or some more complicated procedure.

A striking example of this process has been recorded by W. J. O'Donovan (1927) in a ward-scrubber who was admitted with occupational dermatitis of the hands. One day the visiting physician asked if her legs were all right and expressed a wish to see them. There was then no eruption on the legs, but at a subsequent visit they were found to be red and weeping, a condition which persisted for months.

O'Donovan records this as an example of psychogenic traumatic dermatitis. Admission to an institution and the application of occlusive dressings such as elastoplast or plaster-of-Paris will by the rapid healing of lesions which have persisted for months or years reveal their true nature. At other times an inspection of the patient's belongings will be rewarded by the discovery of the causal agent. Sir Norman Walker (1932) reproduces in his *Introduction to Dermatology* a coloured plate representing an artefact produced by carbolic acid which the patient cleverly concealed in the ward despite constant search for it during three weeks. In the case of eczema or dermatitis chemical

* Read in abridged form at a joint meeting of the Dermatological Section of the Royal Society of Medicine and the Section of Dermatology of the British Medical Association.

thickly studded with cysts, but none were found in the diaphragm Since the cysts were tough the infection was probably of long standing Dr Jacobs is quoted in the same paper as having stated that cysts were frequently observed in the dissecting room ' Sutherland s (1897) case in Glasgow was apparently an infection of short duration death being due to advanced pulmonary tuberculosis - University College Hospital clinical records, 1933, contain an account of the case of a lino porter, aged 56 who died with multiple pulmonary abscesses Several small calcified cysts in the intercostal and axillary muscles show well in a radiograph of the chest Eosinophils were 2 per cent Evidently this was an old infection, but the patient had resided in India, Burma, and Malta, and had served in France from 1914 to 1918

Cobbold (1879) states that "as many as thirty to forty instances had occurred where the parasites in question had been found post mortem," no diagnosis of trichinosis having been made during life, and he further states that "trichina has not been observed in our British fed swine in more than one or two or possibly three instances ' This author also quotes Sir Dominic Corrigan as having stated that 'he had often met with trichiniasis in his practice in Dublin' and that the disease 'was quite common in many parts of Ireland,' but whether the disease was diagnosed or discovered post mortem is not stated and no instances of trichinosis in Ireland have been published except that of Bellingham (1852)

Several small epidemics and isolated cases of trichinosis have been recorded from time to time in Great Britain, the disease being diagnosed correctly in all instances Cobbold (1879) describes the first recognized epidemic, in Workington in 1871, three persons being infected by sausages and boiled pork from a home fed pig Jones (1889) reports an isolated case in Swinton (Yorkshire), due to eating raw home-cured ham, which however, had been supplied from America Harris (1909) records four cases caused by eating salted pork prepared from a privately killed pig in Devonshire A rat killed on the farm at which the pig had been kept was found 'teeming with trichinae

Rice and Williams (1922) give an account of a serious outbreak of trichinosis involving thirteen persons at Milford Haven, caused by eating sausages prepared from pigs bought and slaughtered locally, no evidence of trichinosis could, however be found in pigs from the seven farms supplying the infected animals nor were rats round the farms infected Hardy, and Paul (1927) describe two cases in Smethwick due to eating roast pork from a pig supplied by a Worcestershire farm No trichinosis could be traced among the other pigs nor did rats on the farm show trichinae, in addition the swine were grain fed, and no trichinae were found in over a thousand carcasses examined subsequently Herzberg and Vitenson (1930) report an isolated case in London acquired by eating raw bacon from an untraced source Hickling (1931) also describes an isolated case in London the source of infection not being stated, the patient, however, had never been abroad

The above constitutes all the published records of trichinosis in the British Isles which it has been possible to trace, but in view of the atypical syndrome apparently associated with many cases and the difficulties still attendant upon diagnosis (Hall, 1937) it is not surprising that the disease is recognized during life only in epidemic proportions or in those few cases showing the classical symptoms of muscular pains oedema and marked eosinophilia While trichinosis is in itself rarely fatal, its incidence is nevertheless an indication of the general hygiene of the population and the efficiency of the public health precautions, moreover, mild trichinosis may predispose towards other more serious complications

Since trichinosis may be acquired by persons who never show any symptoms of the disease it is obvious that the incidence indicated by diagnosis during life is no criterion of the frequency or degree of exposure to infection A study of the frequency of subclinical infections is therefore necessary to estimate the true risk of infection and pending improved diagnostic methods such a study can only be carried out post mortem

Materials and Methods

The incidence of trichinosis in London was estimated by digestion of diaphragms from cadavers and examination of the sediment of the digest for larvae Diaphragms were generously supplied by four hospitals, these being Guy s Hospital and the London Hospital, covering a large part of the east and south east of London, and a typical low economic social population, and University College Hospital and the Middlesex Hospital, covering central, western, northern and outlying northerly districts of London, with a larger proportion of persons of higher economic social status

Diaphragms were minced, and weighed amounts usually 100 grammes, or the whole diaphragm if less than 100 grammes in weight digested in 1 000 c cm of artificial gastric juice (0 5 per cent HCl and 1 per cent granular pepsin) at 37° C for twenty four hours, the mixture being constantly stirred The digests were then poured into funnels fitted with 20 mesh brass wire screens After one hour the sediment was drawn off from the base of the funnel, centrifuged, and examined for larvae In addition small portions of diaphragm from near the tendinous insertions were compressed between thick glass plates and examined under the microscope for encysted larvae, since, as Hall and Collins (1937) have shown, larvae which have died previously in the cysts are not present in the sediment after digestion

Even when determined by these two methods the incidence of trichinosis is probably still too low and the actual degree of infection underestimated, because in a few positive cases the diaphragm may be uninfected (*vide* Bellingham 1852) and the amounts used may be too small to give a true result in larvae per gramme (Hall and Collins 1937) Two hundred diaphragms were examined from all age groups from stillbirths to old age, covering a fairly representative selection of population classes and districts in and round London

Observations

Only two out of the 200 diaphragms examined (one case in each 100) showed infection with trichinella giving an indicated incidence of 1 per cent In both cases the infection was slight—one larva per gramme of muscle Case 1 was that of a woman, aged 39, of King s Langley, Herts, who died in University College Hospital of post-cricoid carcinoma Case 2 occurred in a Hampstead woman, aged 58, who died in Middlesex Hospital from gastric carcinoma In neither instance had there ever been any symptoms suggestive of trichinosis and in Case 2 a blood examination showed a normal proportion of eosinophils (2 per cent) Neither patient had ever been abroad, indicating that the infections were endemic In each case microscopical examination of parts of the diaphragm was negative, this is in accordance with the

agents are not required, vigorous friction is sufficient Occlusive dressings, elastoplast and plaster, aggravate the eruption, and for this reason cannot be used To meet these circumstances I employ a wire cage into which the foot and leg can be fixed and locked If the leg thus immobilized responds while the other does not, it may be concluded that friction is protracting the disease This, however, applies equally to true idiopathic eczema where the patient, unconsciously perhaps, succumbs to the violent itching The individual who deliberately aggravates the eruption does not know this, and the plan is thus often effective

For the purposes of this paper I will divide the various types into four groups This classification is dermatological rather than psychological Their clinical characteristics are best illustrated by selected examples

1 The Hysterical Group

This group can be further subdivided into purposeless and purposeful eruptions

(*a*) PURPOSELESS HYSTERICAL ERUPTIONS

These represent the most characteristic and at the same time the most deceptive class This deception lies in the fact that there is no apparent object to be gained, and that even personal appearance may be damaged to the extent of unsightly disfigurement This class is almost entirely confined to young unmarried women, who often exhibit an insensitive conjunctiva or palate, and "glove and stocking" or shifting patches of anaesthesia The following cases are illustrative

Miss E M aged 17 had a number of red inflamed patches on the left shin with superficial scars on both legs Although the eruption had been present for four years after admission to hospital healing was complete in nineteen days I wrote to her four years later to ascertain her subsequent history She had married and no further artefacts had been produced in her reply she asked if her eruption would have any effect on her children, apparently a perfectly genuine inquiry which favours the theory of a double personality She had forgotten, or was unaware of or had suppressed the memory of the four years given to her practice

The next case is more dramatic, and illustrates very well to what lengths individuals affected by this strange neurosis will go

The patient was an intelligent and well-educated woman of 26 a protozoologist by occupation In January, 1919, she broke a test tube, and several tiny fragments of glass were removed from her left hand The lesion never healed, and was replaced by a sloughing ulcerated area An infection from some protozoon or other pathogenic organism was suspected I first saw her in May 1919 and diagnosed dermatitis artefacta She had a short stay in the ward, and under occlusive dressings the sore was reduced to a tiny lesion. She then discharged herself from hospital, and when I next heard of her a finger had been amputated Thus mutilated she remained in apparent good health. In this case a genuine injury had preceded the artificial eruption

Submission to surgical mutilation is indeed not uncommon a remarkable example of this has been recorded recently by E W Prosser Thomas (1937), who emphasizes the curious unemotional indifferent attitude on examination, and one might add on mutilation

His patient for a period of nine years, commencing at the age of 22 produced a series of gangrenous lesions on the left hand and arm necessitating thirty-three operations culminating in complete removal of the left arm The autophytic nature of the eruption was proved when a new lesion developed, for which the patient was admitted to hospital This case is not unique Thomas describes a parallel in Heidingfield's patient, a woman who permitted the amputation of both breasts and one leg before the true nature of the supposed idiopathic gangrenous dermatitis was recognized A lesser example of submission to mutilation with unusual developments, came under my observation in 1932 The patient, a girl of 19 when working as a hairdresser, damaged a finger This was amputated for supposed tuberculosis She then developed on the hand a rebellious ulcer of suspected tuberculous origin On her admission to my ward a diagnosis of autophytic dermatitis was supported by a microscopical examination of the ulcer, which proved its non tuberculous nature She improved and was discharged I ascertained that at a later date she obtained a large sum in compensation for tuberculosis of the skin contracted in her work Her story does not end here Three years later when I again saw her she had three ulcers and an erosion of triangular outline on the right leg all self inflicted The ulcer on the hand had healed but there was hysterical contracture and disuse atrophy

In spite of her past history, and in spite of all I had to say, this characteristic textbook example of self inflicted ulceration of the skin remained, and for all I know still remains, an accepted case of multiple tuberculosis This class of patient does not seek or invite compensation It is as if honour were thrust upon them, and if this lady has a sense of humour she must relish the exquisitely ludicrous situation

One further example with similarities and differences may be recorded as illustrating diagnostic technique

A woman aged 28 developed tuberculosis of the finger necessitating amputation At the hospital where the operation was performed the diagnosis was confirmed by the microscope, and we may therefore unreservedly accept it. When I saw her at a later date she presented a number of ulcerative small lesions extending in a line up the arm, very suggestive of tuberculous lymphangitis Had nothing further happened I would have been satisfied with this diagnosis the mimicry was so perfect. Then the patient became too clever and gave her case away When similar lesions developed along an operation scar on the abdomen I became suspicious and my suspicions were confirmed when, upon her admission to the ward and the application of occlusive dressings, the covered lesions completely and rapidly healed

(*b*) HYSTERICAL AND PURPOSEFUL ERUPTIONS

Those whose cases come under this heading are women of mature age, and they become or have been difficult and unreasonable There is an attempt to evade unwelcome duties with simulation of illness to gather pity

The first example of this class Miss A, aged 42, presented following a scald, an erythematous rash of three months duration confined to the left arm This rapidly healed on admission to hospital About two years later she developed agonizing pain in the right toe which appeared perfectly normal. She was work shy and neurotic, and her doctor informed me that she had previously rubbed lamp-black under her eyes to show how ill and overworked she was We told her that we were aware of her deceptions and this brought her to a better frame of mind

Another case was that of Mrs X aged 45, a chronic alcoholic Following an injury to the left forearm and index finger she developed a series of necrotic areas on the left arm which healed under elastoplast but reappeared when the bandage was removed This continued for six months Her doctor then took charge of the patient, applying and removing the elastoplast himself Various excuses were made to evade this treatment It was nevertheless persevered with and the doctor won. Her home environment should have been entirely happy for she had a devoted husband and children The eruption was an endeavour to find an excuse for her alcoholism

2 The Malingering Group

Although there is no essential difference in the forms the eruption assumes in this group, except that in general they are better copies of a genuine disease, the motive is

previous findings that microscopical examination will almost invariably miss light infestations

Three complete cysts were recovered from Case 1 and twenty-five from Case 2, these had been perforated by the digestive juice, but the larvae were dead inside Examination of these cysts showed that the infections were of long standing, the walls being thick, although any calcification had been dissolved by the gastric juice *Cysts from Case 2 showed a granular mass lying near* the larvae, such as has been described in cysts from a polar bear and by Topham (1850) in man, these are probably masses of excretory material (van Someren, 1937) The remainder of the larvae in each case were free and active

Discussion

These results show that in the districts and population classes examined in and around London trichinosis is an uncommon disease, and the risk of infection apparently very slight, they also suggest however, that endemic reservoir hosts do occur, forming a potential source of danger, since one infected pig is capable of transmitting the infection to many people An explanation of this scarcity of trichinosis may be found in the fact that, generally speaking, the British, even of the lower economic-social classes, have a relatively high standard of hygiene as regards cooking meat being well cooked in the majority of homes On the other hand it is possible that encysted larvae may withstand temperatures sufficient to cook meat thoroughly, especially in the centre of a joint, where the temperature never reaches the oven temperature The Smethwick epidemic was traced to a joint of pork which weighed 9 lb and was roasted for four hours, a time usually considered sufficient to kill trichinae These facts suggest that the reservoir hosts if they do occur, are themselves uncommon, the great majority of the population never being exposed in any way to risk of infection from such sources

The system of pig-rearing in Great Britain is such that swine have little chance of becoming infected with trichinella As a rule gilts intended for breeding and pregnant sows run out at pasture They may farrow in field shelters, or, as in winter, be brought indoors to farrow Where possible the piglings and sow are allowed to run out at pasture a few weeks after farrowing Litters are weaned at 8 to 10 weeks old, after which those intended for pork or bacon are fed indoors and sold fat at 5 to 7 months old *There is very little swill- or* garbage-feeding except around towns or at or near public institutions, and the law requires that all swill must be boiled before use (The Foot-and-Mouth Disease (Boiling of Animal Foodstuffs) Order of 1932 states that boiled' means exposed for a period of at least an hour by any process to a temperature of not less than 212° F) Furthermore, swill-feeding is considered unsuitable for bacon production Where swine are reared on proprietary foodstuffs the Ministry of Agriculture must be satisfied that the process of manufacture or preparation of such foodstuffs includes the boiling of it It will be obvious from these facts that swine in this country have *little* chance of acting as infective bearers of trichinosis to the extent probable in America being mainly pasture-fed, nor can the disease be perpetuated in swine by the feeding of infective trichinous garbage

Local sanitary authorities deal strictly with sanitation in and around farms, and rats can play little part in the perpetuation of trichinosis by the Rats and Mice (Destruction) Act 1919 all lands and premises are required be kept free from rat and mice infestations To assist in preventing these infestations the Ministry of Agriculture recommends that all places likely to be breeding-grounds, such as pig-sties, should be specially dealt with, action in this matter depends of course on the individual occupiers, but the general standard of hygiene and a natural dislike of such infestations ensure that these precautions are carried out satisfactorily wherever necessary, particularly during the national *rat week*

It remains to consider whether imported meats constitute a source of possible infection Of the total pig-meat supply 51 per cent is imported (1936 figures, under revision), this being fresh pork from the Irish Free State, chilled or frozen pork from New Zealand, Australia, Argentina, U S A, and other countries, and salted pork from the Irish Free State, Brazil, Argentina, and other countries (in order of importance) The chief countries exporting bacon are Denmark, Canada, the Netherlands, the Irish Free State, and Poland, and of hams, U S A and Canada Thus pig meat is obtained from countries where trichinosis is still not uncommon, but under the Public Health (Imported Food) Regulations, 1925 (Amended 1933), all imported meat is subject to examination at the port of entry and to seizure and condemnation if found to be unfit for human consumption The importation of certain classes of meat is prohibited unless these are accompanied by an official certificate of the country of origin which has been recognized by the Ministry of Health as affording satisfactory evidence that the meat has been derived from an animal free from disease at the time of slaughter, and that it has been prepared and packed with all necessary precautions for the prevention of danger to public health Certain classes of meat, *however, including bacon, are at present admitted without* an official certificate This has been amended by the Public Health (Imported Food) Regulations 1937, which do not come into operation until January 1, 1938, and which will prevent the importation of any meat or meat product unless accompanied by an official certificate

In view of the special precautions laid down regarding the inspection of imported meat on slaughter it is the practice to inspect only a proportion of such meat at the *port of entry* Carcasses are examined by incision, palpation, and visual inspection, but no microscopical examinations are made It would seem, therefore, that a small channel of entry has been left for the introduction of trichinosis into this country by permitting the importation of bacon without an official certificate, particularly since such bacon may come from countries where trichinosis is more common, and also by lack of microscopical examination Microscopical inspection is carried out in certain of these exporting countries, such as Denmark and the Netherlands, but the regulations at present may permit importation of uninspected bacon The new regulations will be more stringent, and may decrease even the slight incidence already recorded

These data concerning meat importation and pig rearing probably account largely for the relative rarity of the disease in this country, but in view of the fact that sources of infection must occur and that microscopical examination may even lead to a sense of false security, the relatively high standard of hygiene of the British as regards cooking and eating probably still remains the best defence against infection

Summary

Previous records of trichinosis discovered post mortem or diagnosed during life in Great Britain have been

entirely different There is a monetary or other object to gain or a disagreeable duty to avoid This kind of deception was met with during the war, and was often very difficult to detect Long after the war I learned of the ingenious procedure used to mimic boils A piece of tinfoil was stretched over the skin, and through this a number of tiny punctures were made with a needle Sand was then rubbed over the surface, and in twenty-four hours a perfect imitation of a boil appeared on the skin, this device could be repeated indefinitely In such cases a plan is formed to injure the normal skin the intention precedes the lesion In other cases a genuine eruption is already present which is deliberately aggravated by the malingerer This applies in particular to occupational dermatitis, and may explain some of those cases where the dermatitis persists long after the workman has been removed from contact with the supposed causal irritant It would be wrong and unjust to suspect as fraudulent more than a very small minority of this class Most of them are examples of idiopathic eczema developing in a workman, and the fault lies not with the workman but in the diagnosis of occupational disease, although it must be admitted that upon this question conflicting and different opinions are held

3 The Mischief Group

Children as a class enjoy mystifying their elders Allusion has already been made to the epidemics of bald patches mimicking alopecia areata or ringworm which occasionally break out in schools Other examples of autophytic dermatitis are met with from time to time in children where a spirit of mischief seems to explain the circumstances The following belongs to this group

A bright intelligent child aged 10 years was seen by me for an eruption which had been present for three weeks It was said to "come up in blisters There were numerous irregular pigmented patches and spots scattered over the right shoulder forearms and thighs Some were linear or irregular, and the whole picture was so absurdly unnatural as to suggest at once an autophytic dermatitis When I made further inquiries I was informed that a small cousin living with the family had a similar condition I saw this child and her eruption was identical but less pronounced I learnt later that a stripping acid was being used to remove paint from a punt and it was suggested that this had splashed over the two children Application of this acid to my arm produced no result and it must therefore be concluded that something else which was never identified was used Both children recovered and no further developments took place

4 The Phantom Dermatoses

Every medical practitioner has from time to time encountered the patient who comes complaining of a rash which he or she thinks is obvious and even disfiguring but of which little or nothing is visible to the unprejudiced observer A similar attitude of mind with a somewhat different reaction is found in another and relatively large class almost always women with acne or rosacea who state when they present themselves for examination that their eruption has suddenly become much better and they will usually add that it has behaved like toothache which disappears when a visit is made to the dentist Actually no sudden or pronounced change in the objective condition has taken place—the nature of the eruption in itself makes this impossible The change lies in their own perception of it they have, like most people with a skin disease and especially a disease on an exposed surface exaggerated its actual proportions At the consultation and in the presence of an expert they come to see the condition as it really is From this it is not a far step to true phantom dermatoses where the patient inflicts upon the skin an eruptive process that is purely imaginary In this sense such phenomena are autophytic The following case will serve to illustrate this curious hallucination

An ex officer whose war experiences had been long and exhausting complained of a repeated and localized swelling of the face which developed at irregular intervals lasted for some time and then subsided completely Nothing could be found to account for the condition nor was the actual eruption ever seen The accessory nasal sinuses were examined and found to be healthy Recurrent giant urticaria seemed a possible explanation, but the patient's description of the swellings was so vague and unconvincing as to cause suspicion of their reality To test their genuine character I said that the telephone was always available and that I was prepared to make a visit at any hour of the day or night when next the eruption appeared Nothing further happened the swellings ceased and in this way my suspicions were seemingly confirmed

Conclusion

I shall conclude my observations with a short survey of the autophytic dermatoses from the dermatologist's point of view When the patient derives some advantage from the eruption suspicions are usually aroused, and careful investigation will often discover the means by which the lesions are produced A far more difficult problem is presented by the so called hysterical class Recognition and disclosure of the true state of affairs, far from bringing the matter to an end, in most cases only raises new and perplexing problems The dermatologist can rarely give any reason which will satisfy the incredulous relatives and explain the perverted behaviour, nor is it as a rule possible at first to identify the exact method by which the deception has been carried out—an apparent defect in the argument which creates further doubt, sometimes shared by the practitioner in charge of the case Nothing is gained by confronting the individual with the deception The result is always an indignant denial, made with so much semblance of truth as to shake the confidence of anyone who is not certain of his facts In these cases be it remembered the usual procedure is reversed a positive diagnosis being made upon what may be called negative evidence Even when the case is established beyond reasonable doubt the diagnosis is still denied by the patient and only grudgingly accepted by the friends The exposure is never popular It behoves us therefore to be very careful before reaching a conclusion and never to express an opinion unless we can completely satisfy ourselves and others No mistake in diagnosis is more resented

What happens to these patients? I have been able to follow up the after history of eleven young women with hysterical eruptions (MacCormac 1926) All but one had ceased to inflict lesions on the skin and the replies to my letters of inquiry received from some of the former patients reveal the curious fact that the knowledge of what they did had been forgotten or submerged

The foregoing is mainly concerned with diagnosis the signs by which self inflicted lesions of the skin are recognized That merely touches the fringe of the subject for these eruptive processes are not skin diseases as ordinarily understood except in the malingering class, but rather a reflection upon the skin of a disordered condition of the mind

summarized and extended by a survey of the incidence of trichinosis in 200 necropsies at four hospitals in London, covering a representative selection of districts and population classes in and around London

The scarcity of previous records and the present findings of an incidence of 1 per cent indicate that trichinosis is uncommon in Great Britain Both cases found in the present survey had light infections, but the infection was endemic

The system of pig rearing in this country is such that swine can have little chance of acting as infective bearers of trichinosis, but imported bacon may form a slight source of infection

The general level of hygiene and habits of the British peoples probably plays the principal part in reducing risk of infection

In conclusion it is a pleasure to thank Professor G P Wright and the staff of Guy s Hospital pathology department Professor H. M Turnbull and the staff of the pathology department of the London Hospital Professor J McIntosh and the staff of the Bernhard Baron Institute of Pathology Middlesex Hospital and Dr G R Cameron and the staff of the pathology department of University College Hospital for generous assistance and co-operation in providing material from necropsies carried out at these hospitals Mr W McDonald of the helminthology department of the London School of Hygiene and Tropical Medicine kindly made a number of the examinations in my absence and Mr Nicholson laboratory assistant in the same department, gave valuable assistance in the routine work connected with these examinations

The Ministry of Agriculture and Fisheries and the Ministry of Health generously supplied information concerning the system of pig rearing and meat inspection in this country I have also to thank the Imperial Bureau of Agricultural Parasitology for tracing most of the published records of trichinosis in Great Britain

This work was carried out under a Medical Research Council grant to Professor R T Leiper F R S to whom my sincere thanks are due

G F Göthlin (*Acta paediatr* Stockh , October 1937, p 71) gives an account of the employment of the capillary fragility test for judging the effectiveness of the supply of vitamin C in adults and in children It was found that in certain parts of Sweden there were school children who although not ill exhibited during the late winter and the spring a fragility of their cutaneous capillaries due to a deficiency of this vitamin in their diet These children had a normal capillary resistance in the summer This test is of value when there are no resources for estimating the amount of ascorbic acid in the blood but can only be applied to fairly healthy persons If the findings of a first test are doubtful ascorbic acid is given for a week and the test repeated A detailed account of how to apply the test is given.

PREVALENCE OF MIDDLE-EAR DISEASE IN ELEMENTARY SCHOOL CHILDREN

OTOSCOPY AS AN ADJUNCT TO ROUTINE MEDICAL INSPECTION*

BY

F J G LISHMAN, M D D P H, D L O

Assistant Medical Officer of Health Oxford

In this investigation an attempt has been made to assess the prevalence of middle-ear disease in elementary school children seen at routine medical inspections

The Chief Medical Officer to the Board of Education referred in his report for the year 1934 to a particular symptom of middle-ear disease, otorrhoea, and explained that the ordinary methods of routine medical inspection give an understated assessment of its prevalence useful only for comparative purposes from year to year A section of this report may be quoted here

> An ear may have no discharge for a long period and be apparently cured yet as the result of slight nasopharyngeal infection—for example a common cold—or often from no ascertainable cause the ear may begin to discharge again The system of routine medical inspection therefore only detects those cases that have active otorrhoea at the time of examination and since as a rule it does not include a detailed examination of the ear even some of the active but slight cases may be missed Were an examination of the ears by an electric auriscope included in routine medical inspection there is no doubt that more cases of slight otorrhoea and potential otorrhoea would be discovered The practicability of amplifying routine medical inspection in this way should receive consideration by school medical officers"

The Incidence of Otitis Media

This opinion is supported by evidence supplied by Dr W A Bullough, school medical officer for Essex, whose report for 1934 contained an account of an investigation by Dr A Elliott in which 2 074 Dagenham elementary school children were subjected at routine medical inspection to otoscopy and special inquiry made in each case regarding any history of ear discharges This procedure resulted in finding an incidence of 4 82 *per cent* cases of chronic otitis media while of these only 31 per cent. (that is 1 49 per cent of the 2 074) were continuous, 69 per cent (3 33 per cent of the 2,074) being intermittent and therefore liable to have been missed by the ordinary routine methods It is presumed that all the cases so detected may be considered as requiring treatment,' but the author does not record cases of non suppurative otitis media (such as chronic catarrhal otitis with an intact drum) requiring treatment—which latter are presumably included in the Board of Education figures given below—nor is the age distribution of the children given, though as the investigation was commenced in April, 1934 and completed before the end of the same year it appears unlikely that all age groups are included The figures therefore are not strictly comparable to those issued by the Board which for cases of otitis media requiring treatment *per thousand* children seen at routine medical inspection are as follows

1929	1930	1931	1932	1933	1934	1935
5 3	5 4	5 1	5 1	4 7	4 6	4 1

Thus in 1934 the figure given by the Essex investigation for only otitis associated with active or potential otorrhoea was over ten times as great as that for all forms of otitis media requiring treatment found at inspections throughout the country as a whole and although, as the

SULPHANILAMIDE IN THE TREATMENT OF ERYSIPELAS

A CONTROLLED SERIES OF 270 CASES*

BY

W. R. SNODGRASS, M A, B Sc., M D, F R F P S Glas

Assistant Physician Western Infirmary Glasgow

AND

T ANDERSON, M B, Ch B, M R C P Ed

Deputy Superintendent Ruchill Hospital Glasgow

A report to the Therapeutic Trials Committee of the Medical Research Council on the effect of prontosil "red" in the treatment of erysipelas was recently published by us (Snodgrass and Anderson, 1937) Using ultra-violet light as the method of treatment in the control group, it was concluded that those cases which received prontosil "red showed better results in respect of the curtailment of (1) the duration of the spread of the local lesion, (2) the duration of primary pyrexia, (3) the duration of toxaemia The evidence supporting these statements was assessed statistically

Tréfouel, Nitti, and Bovet (1935) showed that *p* aminobenzene sulphonamide was as effective as prontosil "red" in controlling streptococcal infection in the mouse Colebrook, Buttle, and O Meara (1936) and later Fuller (1937) produced evidence to show that the red dye was itself inactive but was reduced in the body to a colourless active substance, and that this substance was *p*-aminobenzene sulphonamide, now commonly called sulphanilamide The present report has as its main objectives the following three points (1) the investigation of the therapeutic benefits of sulphanilamide in erysipelas, (2) the investigation of the effects of a larger and more prolonged dosage in respect of the therapeutic criteria mentioned above and also in respect of the prevention of recurrence, (3) the investigation of the effect of varying dosage of sulphanilamide during the first twelve hours

The material consists of all cases diagnosed as erysipelas after admission to Ruchill Hospital, Glasgow, from the middle of February to the middle of August, 1937 Ruchill Hospital receives all notified cases of erysipelas admitted to hospital in Glasgow, so that the material is thoroughly representative of the incidence of the disease in this district during the period reviewed All patients were under the clinical control of one of us (T A)

Plan of Investigation

Apart from the specific treatment shortly to be described all cases were treated under strictly comparable conditions The wards to which they were admitted and the personnel of the nursing staff were common to all cases On admission each patient was given a soap and-water enema, repeated when necessary Thereafter the same laxative—liquid paraffin—was used when required A standard diet was adopted, which, in view of its importance when cases are being treated by sulphanilamide or its congeners, we give in full

(*a*) During the stage of pyrexia the patients receive a fluid diet which may contain any of the following barley water Imperial drink, milk, glucose in water, Horlick's malted milk, chicken tea, arrowroot, cornflour and junket Most patients receive bovril at night, and in addition are encouraged to eat oranges and grapes

(*b*) About the second to fourth day the diet begins to become more solid, and may contain porridge fish, chicken chicken cream custards, jellies, and fruits This diet is continued until the end of the first week

(*c*) During the second and any subsequent week ordinary diet is resumed—for example mince, stew, vegetables such as potatoes cabbage, and turnip steamed puddings, and milk puddings

No eggs or onions have been included during the first week in hospital.

An enema is given before treatment is begun and is repeated in some cases on the second and third mornings

No local treatment was given As in the first series of cases, ultra-violet light was used as a control method of treatment The cases were, in the order of their admission, assigned to two treatment groups Cases in Group 1 received treatment in the first instance only with ultra violet light Cases in Group 2 received treatment only with sulphanilamide There were 270 cases in all, 135 in each group The series remained complete, as after further observation the original diagnosis of erysipelas was considered to be correct

Since our first report showed that prontosil "red" was of greater therapeutic effect than ultra-violet light, it was felt that seriously ill patients who were not improving under ultra-violet light therapy should receive sulphanilamide Accordingly twelve of the cases originally placed in the ultra-violet light group ultimately received treatment with sulphanilamide

Details of Treatment

Ultra-violet Light—A portable mercury-vapour lamp (Messrs Kelvin, Bottomley, and Baird) was used at a distance of twelve inches from the margin of the lesion For female cases the exposure was of eight minutes' duration, equal to one and a half erythema doses, for male cases the exposure was for ten minutes—in each case once daily Exposures were repeated at intervals of twenty-four hours when considered necessary The average number of exposures was 1 4 per case

Sulphanilamide—The preparation used was that marketed under the trade name of "streptocide" by Messrs Evans Sons Lescher and Webb Ltd, to whom our thanks are due for the generous quantities provided for the tests Treatment was begun immediately on admission, and in all cases the drug was given by mouth It was administered in 1-, 2-, or 3-gramme doses at four-hourly intervals, and such dosage was continued until the temperature of the patient became normal The average duration of this period of treatment was 2 5 days, during which the average case dosage of sulphanilamide was 14 64 grammes Thereafter 0 75 gramme was given thrice daily until the patient left hospital The average stay in hospital was 14 4 days, with an average total case dosage of 41 6 grammes of sulphanilamide

The form in which the drug is given seems to us worthy of comment In some of the earlier cases undissolved tablets were evacuated by the bowel It was found, too, that with the larger doses the patient had difficulty in swallowing the required number of tablets In the majority of the present cases, therefore, the drug was administered in powder form

* A report to the Therapeutic Trials Committee of the Medical Research Council.

Chief Medical Officer pointed out, the national figures understate the true picture, the actual degree of understatement suggested by the Essex figure is startling

Otoscopy in Routine Medical Inspections

These observations regarding otorrhoea and otitis media should apply equally well to middle ear disease in general, and so with a view to testing the practicability of adding otoscopy to ordinary routine medical inspections under field conditions without any special arrangements or warning and over a reasonably long period of time, and to assessing the prevalence of the commoner forms of middle ear disease, I commenced in January, 1936, to practise otoscopy of every child seen at routine inspections The innovation was received very well, meeting with no opposition from teachers or parents, and often being highly appreciated More important, the otoscopic examination was very well tolerated by children of all ages, only two or three infants during the whole investigation raising any protest Lastly, and contrary to expectation, it adds very little to the time taken to inspect a batch of children, it being found that on an average only about thirty seconds per child seen must be added to the usual time allowed, for in most cases otoscopy of both ears can be accomplished in ten seconds, which leaves an adequate margin for more prolonged examination of diseased ears This means only an extra ten minutes for twenty children That time so spent is of value is shown by the results of this investigation

An ordinary electric otoscope with round-section specula in three sizes, and with no lens, is used The round-section specula are more convenient than the oval-section type for rapid examination of children of varying height needing frequent changes of posture by the examiner, and it has been found much more satisfactory to dispense with the lens usually fitted to the illumination chamber, for in these children the length of the external auditory meatus is so variable that no single lens can be expected to give a clearly focused image of the structures at the distal end of the meatus in every case The open unobstructed chamber also saves time if palpation of abnormal meatal or tympanic structures such as polypi is desired, while if Siegle's method is used to test drum mobility or to detect a very minute perforation the lens can always be inserted momentarily To the presence of the lens, indeed, may be attributed much of the difficulty which those unfamiliar with otoscopical examination may at first experience, because lenses are usually fitted by the instrument makers with a focal length too short, so that a clear image can only be obtained at the actual end of the speculum, and not half to three quarters of an inch further down the meatus, as is required for the drum or other tympanic structures

The System of Investigation

The investigation was begun in the Surrey County Council elementary schools in the county area comprising the borough of Godalming, the urban district of Haslemere, and the large rural district of Hambledon On an average the district might be considered more rural than urban

Between January 1 and May 31, 1936, when I moved to Oxford, 763 children were seen at routine medical inspections In this area the first, or 'entrant,' age group of children are seen in the autumn term, the 'intermediate,' or 8-year-old, group in the summer term, and the 12-year-old group in the spring term, hence the age distribution of the 763 children is above the average, and as older children have had more time in which to acquire chronic disease this fact might be considered to favour an overstatement of the prevalence of middle-ear disease This criticism, however, does not apply to the remainder of the investigation, which was carried out in the elementary schools of the county borough of Oxford, for in this case the results of the inspections during a complete year are recorded and all age groups are embraced in approximately equal numbers, though, if anything, the balance is in favour of the younger ages Altogether in Oxford 1,634 children were seen during the year, giving a total of 2,397 for the two areas together

Records were kept in an 'Ear Book,' as follows

1 The number of children inspected on the day's date

2 The number of children in whom middle ear disease was detected by the ordinary procedure of routine inspection—that is from the history given by the parent verbally or on the questionary form circulated before each inspection in both the areas concerned, and from a superficial examination without otoscopy

3 The number of children in whom disease was detected when the above procedure was supplemented by otoscopy

4 The number of children in whom further inquiry after disease had been discovered by otoscopy, revealed a history of ear trouble not previously mentioned (usually because the parents had not considered it important enough)

5 The name and sex of each child found with middle-ear disease

6 The particular diseases or conditions of the middle ear found

From these daily records the results for each term are obtained by summation

In the case of a child having bilateral disease, if the same disease is present on both sides it is recorded as only one 'case," but if the pathological condition in one ear differs from that in the other each is recorded separately as a "case", hence, as will be seen from the tabulated findings, the sum of the "cases' slightly exceeds the number of children found afflicted with ear disease

Children showing evidence of operations for mastoiditis (of which there were five among the 763 Surrey and nine among the 1,634 Oxford children, giving a total of fourteen cases among 2,397, or 5 8 per 1,000 children) are not included separately as old mastoiditis" in the table, but are placed under the heading most appropriate to the condition of the middle ear at the time of examination For example, if either wound or meatus is discharging pus the case is recorded as chronic suppurative otitis media," or if both wound and drum are healed and healthy, as "healed otitis media' Incidentally, some of the operation wounds were so inconspicuous that the old mastoiditis might have been missed had not the otoscopic appearance suggested further investigation, also once or twice no history of operation was given

Cerumen was found to be much less of a nuisance than expected It was very rarely plentiful enough to obstruct the view of the drum, and when this did occur no attempt was made to clean out the ear on the spot, the ear being classed as healthy and the child referred to a clinic for syringing and re examination It has been found, however, that the presence of excessive cerumen is scarcely ever associated with middle-ear as distinct from external-ear disease, and hence the recording of the occasional wax-filled ear as normal results in no significant understatement of the incidence of middle-ear disease

The Findings

The findings of the investigation are recorded in the table, from which the following may be selected for particular comment First as expected, there is a marked difference between the number of children detected with middle-

Records of Results

The following data were noted in each case sex age duration of illness before admission and whether the disease was primary or recurrent idiopathic or traumatic The local lesion was considered with regard to its site extent, swelling painfulness and tenderness The patient s temperature and pulse rate were recorded four hourly and toxaemia was estimated under the following headings —prostration headache state of tongue insomnia vomiting abdominal distension, and delirium The urine was examined daily Intercurrent diseases or degenerations were described, complications relapses and recurrences were noted Each case was reviewed daily In short, a careful attempt was made to record similar observations on each case in a comparative manner

Assessment of Results

1 The distribution of the individual cases in the two treatment groups must be considered in respect of certain factors known to influence the course of the disease Those regarded of greatest importance are (*a*) the duration of the disease before admission to hospital (*b*) the age of the patient (*c*) the severity of the infection (*d*) associated diseases Tables constructed to show the relation of these factors to the types of treatment indicate an even distribution A statistician who has examined them is satisfied that there was no weighting of any one line of treatment by any of these factors

2. The question when cure" is achieved has to be determined The fatality rate in erysipelas is so low that it cannot be used in a small series of cases to assess the value of a therapeutic measure There is no single clinical feature which can be regarded as a satisfactory criterion of recovery Cases are seen where the lesion continues to spread after the temperature has become normal and, again it is not uncommon for the local lesion to cease spreading while the temperature is still elevated and the patient continues in a toxic condition In order to arrive at a conclusion in this series of cases attention was paid to the following points from the commencement of treatment (i) the duration in days of spread of the local lesion (ii) the duration in days of the primary pyrexia, (iii) the time in days which elapsed until the patient was free from the toxic symptoms These are the criteria which were used in our previous report

Results of Treatment

The total number of cases in each treatment group is 135 In compiling the following tables we have adhered to our previous decision to exclude from them all patients who died In addition there are in this series a number of cases responding so badly to ultra violet light therapy that in the interest of the patient sulphanilamide was given It is difficult to assign those twelve cases, which may be termed failed ultra violet light to either treatment group In our clinical judgement all of these patients were seriously ill when sulphanilamide was given and yet nine recovered Clinical judgement however is not statistically assessable, and as the following tables have been subjected to statistical analysis the failed ultra violet light cases must be excluded They will be dealt with in a separate paragraph The exclusion of five deaths from the sulphanilamide group reduces it to a total of 130 cases and the exclusion of the twelve failed ultra-violet light cases and one death in the ultra violet light group leaves 122 cases in that group

TABLE I—*Spread of Lesion*

Method of Treatment	Duration of Spread in Days						Total Cases
	0	1	2	3	4	5 and over	
Sulphanilamide	78 (60 0)	48 (36.9)	3 (2.3)	1 (0 77)	—	—	130
Ultra violet Light	48 (39 3)	24 (19 7)	17 (14)	12 (9 9)	14 (11.5)	7 (5 7)	122

The figures in parentheses are percentages.

Table I shows a decidedly more favourable result as regards cessation of spread in those cases which received sulphanilamide Thus the proportions of cases which showed no spread of the lesion after the end of the first day are ultra violet light 59 per cent sulphanilamide 96 9 per cent After two days in hospital the lesion continued to spread in only 0 77 per cent of cases receiving sulphanilamide but with ultra violet light the lesion continued to spread in 27 1 per cent (The corresponding percentages for ultra violet light in our first report were 59 1 per cent for the end of the first day and 23 4 per cent after two days)

TABLE II—*Duration of Primary Pyrexia*

Method of Treatment	Duration of Pyrexia in Days								Total Cases
	0	1	2	3	4	5	6	More than 6	
Sulphanilamide	5	48 (38 4)	40 (32 8)	19 (15)	9 (7)	2 (1 6)	1 (0 8)	—	130
Ultra Violet Light	10	8 (8)	25 (22 3)	14 (12 5)	10 (8 9)	15 (13 4)	11 (9 8)	9 (7 9)	122

The figures in parentheses are percentages given after deducting those cases which were apyrexial

Table II shows a more favourable result as regards duration of pyrexia in those cases receiving sulphanilamide Thus after deducting the cases which were apyrexial the percentages of those with no fever after forty eight hours treatment are ultra violet light 47 3 sulphanilamide, 75 2 Pyrexia continued for more than three days in only 9 6 per cent of cases receiving sulphanilamide but with ultra violet light the equivalent percentage was 40 (In the first report the corresponding percentages for ultra-violet light were 49 and 38 1 respectively)

TABLE III—*Duration of Toxaemia*

Method of Treatment	Duration of Toxaemia in Days								Total Cases
	0	1	2	3	4	5	6	More than 6	
Sulphanilamide	2	22 (17)	38 (29 7)	38 (29 7)	18 (14 1)	8 (6 25)	3 (2.34)	1 (0 78)	130
Ultra violet Light	6	17 (14 6)	27 (23 3)	22 (18 9)	17 (14 6)	15 (13)	10 (8 8)	8 (6 9)	122

The figures in parentheses are percentages given after those cases in which there was no toxaemia have been deducted

Table III shows a slightly more favourable outcome as regards duration of toxaemia in those cases which received sulphanilamide Thus after deducting the cases with no assessable degree of toxaemia the percentages of those free from signs of toxaemia at the end of forty-eight hours treatment were ultra violet light 37 9 sulphanilamide 46 9 After three days in hospital 23 47 per cent of all cases receiving sulphanilamide remained toxic, the equivalent percentage with ultra violet light was 43 3 (The corresponding percentages for ultra violet light in the first report were 39 08 per cent at the end of forty-eight hours and 39 07 per cent after three days)

ear disease by the ordinary routine inspection and the number detected when the latter is supplemented by otoscopy. Thus in the Surrey area the former method revealed twenty five cases in 763 children, but with the addition of otoscopy the twenty five were increased to seventy four, giving proportions of 33 and 97 per 1 000 respectively. After otoscopy had revealed disease the parents of a further twenty eight children or 37 per 1 000 furnished a history of ear trouble making a total of fifty three with a positive history. The inability to secure a positive history in every case of disease detected by otoscopy is explained by some of the parents being absent and neglecting to fill in and return the questionary form while the younger children cannot always remember or describe their symptoms.

Table showing the Prevalence of Middle ear Disease in 2 397 School Children

Area	Surrey 1936			Oxford, 1936-7					Total
School Term	Spring	Summer (1st half)	Total	Summer (2nd half)	Autumn	Spring	Summer (1st half)	Total

Do. per thousand	128	75	113	89	95	75	81	84	93

In Oxford during a complete year 1 634 children were seen among which forty nine or 30 per 1 000 children with middle-ear disease were discovered by the ordinary routine and 136 or 83 per 1 000 with the aid of otoscopy after which a history of ear trouble was obtained in a further sixty one children—37 per 1 000 as in Surrey. For the two districts together, with a total of 2,397 children seen 31 per 1,000 children with middle ear disease were detected without and 88 per 1,000 with the aid of otoscopy.

Concerning the statistical significance of these findings, the examination supplemented by otoscopy as compared with the ordinary examination gives in the case of the Surrey children an increase of 6·4 per 1 000 or 6 4 per cent. The 'standard error' of this difference computed for 763 observations for each of the groups experimental and control, since the actual children submitted to each procedure are the same, works out at 1 52 per cent. Thus the observed percentage difference is more than four times the standard error, and hence is very unlikely to have arisen by chance. Still less so is the observed difference noted in the case of the 1,634 Oxford children, which is 53 per 1,000, or 5 3 per cent—five times the standard error of 0 96 per cent—while in the case of the total of 2 397 children the observed difference given by the two methods is 5 7 per cent—seven times the standard error of 0 82.

A comparison between the Surrey and Oxford figures would be hardly fair, the Surrey children all being seen in the course of a term and a half and not including any of the first or 'entrant' age group, in which the incidence of any chronic illness might be expected to be less than in older children. Yet as the table shows, there is only a slight difference between the final figures for the two districts though in each there is considerable difference in the incidence of ear disease from term to term. The numbers seen per term however are too small for it to be asserted that such differences occur otherwise than by chance.

It is interesting to note that only two among the ninety-seven Surrey children found to have some form of middle-ear disease failed to hear the 'forced whisper' test (then practised in the Surrey area) in each ear at twenty feet although according to teachers reports a greater number actually appeared to have somewhat impaired hearing. The unreliability of the whisper test in which although vowel sounds are greatly suppressed the consonants are as loud as in ordinary speech has led me to abandon this test altogether in Oxford and in lieu of hearing tests by gramophone audiometer, to rely on teachers' reports and the response to conversation in a quiet voice during the examination, sometimes supplemented with a watch tick test.

Incidence of the Varieties of Middle-ear Disease

Concerning the incidence of the commoner varieties of middle ear disease in the children seen the table separates these conditions into two categories, otorrhoeal and non-otorrhoeal. In the first category cases of acute chronic or quiescent suppurative otitis media are placed. The last mentioned term describes those cases in which the perforation still exists but at the time of examination no discharge was evident. This condition is particularly dangerous because often symptomless and thus apt to be forgotten or ignored by the parents so that the child runs a constant risk of a flare up of acute otomastoiditis from a fresh infection not only by the external meatus but as Tumarkin (1934) has emphasized, by the Eustachian tube for the perforation allows escape of air from the tympanum and so facilitates a massive passage of infectious material up the tube when nasopharyngeal pressure is suddenly raised, as in violent nose blowing or during the respiratory struggles of a child learning to swim. The cases of chronic suppurative otitis media include a few with polypi or cholesteatoma.

In the second category are placed those pathological conditions not associated with ear discharge—namely,

For ease of comparison the main results of the three preceding tables are presented in Table IV along with the standard errors of the differences

In this table the standard errors of the differences in I and II render the percentage differences significant

TABLE IV

		Ultra violet Light	Sulphanil amide	Standard Error of the Difference
I	Ceased spread by end of first day	59 0	96.9	±4 7
II	No fever after 48 hours	47 2	75.2	±6 1
III	No toxaemia after 48 hours	37 9	46.9	±6 3

With regard to III (duration of toxaemia) although the difference is not statistically significant many of the cases (35 5 per cent) showed toxic effects from the administration of sulphanilamide This makes comparison more difficult

Recurrence

Recurrence took place in eight cases in the ultra-violet light group, a percentage incidence of 5 9 in the sulphanilamide group two cases were seen, a percentage incidence of 1 5 The difference is suggestive (S E ± 2 4) In our first report the recurrence rates were 11 5 per cent for ultra-violet light and 8 5 per cent for prontosil ' red ' It will be noted that there is a decided fall in both percentages in this second series of cases While the evidence is not conclusive the repetition of the lower percentage in the group receiving sulphanilamide strongly suggests that these drugs are of value in preventing recurrence

Complications

Here are included the septic complications directly attributable to infection with erysipelas Among such conditions are abscess formation, septicaemia, thrombosis, and nephritis There were eleven cases in the sulphanilamide series a percentage incidence of 8 1 There were twenty-eight cases in the ultra-violet light series, a percentage incidence of 20 7 The difference between these percentages is almost three times the standard error, which affords further evidence indicating the superiority of sulphanilamide over ultra-violet light

Cases Transferred from Ultra violet Light Therapy to Sulphanilamide

The twelve cases which received sulphanilamide in addition to ultra-violet light are shown in detail in Table V The three deaths occurred in elderly patients suffering from heart disease Several of the others were extremely ill indeed, and made remarkable recoveries notably Cases 3670, 2766, and 1574 It is recalled that these twelve cases have been removed from Tables I II, and III to allow of such tables being dealt with statistically Here however it can definitely be stated that, in our clinical opinion, sulphanilamide contributed to the recovery of many of them

TABLE V — *Failed Ultra violet Light Cases*

Case No	Sex	Age in Years	Day of Illness on Admission	No of Doses of U V Light	Day of Illness when Sulphanil amide begun	Dose given (Total)	Day of Illness on which Cessation occurred of—			Remarks
						Grammes	Spread	Toxaemia	Pyrexia

2167	M	80	2nd	2	4th	37	4th	9th	9th	Died 9th day Auricular fibrillation Epithelioma of tongue. Retro-orbital cellulitis

Deaths

There were nine deaths in this series—a fatality rate of 3 4 per cent Table VI gives the relevant information

TABLE VI —*Details of Fatal Cases*

Case No	Sex and Age	Method of Treatment	Dosage	No of Days in Hospital	Remarks
2167	M 80	U V light (failed)	2 doses U V L. + 37 grammes sulphanilamide	7	Epithelioma of tongue
1029	M 70		5 doses U V L. + 25 grammes sulphanilamide	13	Admitted as senile Erysipelas quite subsided at death
2079	F 69		3 doses U V L + 9 grammes sulphanilamide	6	Operation for cataract prior to admission Myocarditis with auricular fibrillation
3081	F 7 days	U V light	1	1	Premature marasmic baby
3474	F 87	Sulphanil amide	21 grammes	13	Admitted as senile Erysipelas quite subsided at death
3487	F 41	"	12 grammes	15 hrs	Bronchopneumonia and septicaemia on admission
3616	F 69		9 grammes	3	Intertrochanteric fracture of femur on admission Bronchopneumonia
1828	M 55		4 grammes	8 hrs	Dying on admission
3539	M 58		14 grammes	2	Admitted with bronchopneumonia Myocarditis and failing heart

cases of old suppurative otitis media apparently healed but with scarred drums, acute catarrhal ' (or "sub-acute') otitis media, chronic catarrhal otitis media, chronic adhesive process (which may be considered to be an advanced stage of the previous condition, with tympanic structures matted by adhesions, and stricture of the Eustachian tube), retraction of the drum due to temporary Eustachian obstruction and without obvious catarrhal changes in the middle ear itself, and finally any other condition noted

In the first category the Surrey children give an incidence of active suppurative otitis media of 9 2 per 1,000, the Oxford children 6 7, and both together 7 5 per 1,000 After adding the cases of quiescent or old disease with an unhealed perforation, the figures for all active or potential otorrhoeal disease are increased to 30 for Surrey, 18 for Oxford, and 22 per 1,000 for the total

If the 1934 Dagenham figures for "chronic otitis media" refer only to the suppurative or discharging type, as is suggested by all the cases described being associated with active or potential otorrhoea, it will be seen that the Surrey and Oxford figures are both lower than those of Dagenham, which from the percentages given in the report referred to work out at 15 cases of active and 33 of potential otorrhoeal otitis per 1,000, or a total of 48 cases per 1,000 children

Concerning the second category of middle-ear disease, not associated with either continuous or intermittent otorrhoea, the frequency with which old cases of suppurative otitis media, now healed, were discovered will be noticed This condition, interesting to record, is probably the least important of all those noted as regards prognosis, for if the drum is nicely healed and healthy in appearance the other tympanic structures are unlikely to have sustained permanent damage Attention is drawn, however, to the number of cases of chronic catarrhal otitis media and the four cases of chronic adhesive process noted, since these conditions are apt to cause the distracting symptom of tinnitus in addition to deafness

Two cases are recorded under ' other conditions" one being that of a Surrey girl with circumscribed labyrinthitis and irritative symptoms, the other that of an Oxford boy with a healing traumatic rupture of the tympanic membrane As regards sex, no significant difference was shown, rather more girls than boys were afflicted in Surrey, but the converse was noted in Oxford

Comparison with Board of Education Figures

It is of interest to compare the findings in this investigation with the Board of Education figures previously mentioned, but in order to obtain comparable figures only those children with "*otitis media requiring treatment*' must be considered Of the various conditions recorded in the table only healed otitis media may be regarded as requiring no treatment while neither ' retraction of the drum due to Eustachian obstruction ' nor traumatic rupture of the drum is strictly otitis", but after subtracting these there remain forty three cases, or 57 per 1 000, of otitis media requiring treatment in the Surrey area, sixty cases, or 37 per 1 000, in Oxford and 103 cases, or 43 per 1 000 for the children in both districts together, the latter proportion being approximately ten times the Board of Education figure for all children seen at routine inspection during 1935

The Preliminary Audiometer Test

There is thus evidence to establish the value of otoscopy in routine medical inspection, but the question may now be raised whether otoscopy of each child would still be necessary if a preliminary audiometer test of the batch of children due for inspection were carried out, for this would enable the examiner to choose only a fraction of the children for otoscopy In 1933 Wells examined 2,083 London school children with the gramophone audiometer and found 13 7 per cent (285 children) to have a hearing loss of nine or more units He then examined 246 of these selected children and found ninety-two cases of 'catarrhal changes in the ear, forty six of otorrhoea, five of 'dry perforation," eleven of Eustachian obstruction, and forty-three of other pathological conditions of the ear, nose, and throat, exclusive of wax The audiometer is also useful in detecting certain ear conditions, other than strictly *middle*-ear disease, which are likely to be missed by otoscopy alone—notably otosclerosis, in which the flush over the promontory is often hard to see through the drum, and invisible if the latter is thickened On the other hand, otoscopy enables the detection not only of certain middle ear conditions, such as ' dry perforations ' and old healed otitis with scarred drums, in which hearing loss may be negligible, but also of pathological conditions of the external auditory meatus which would be missed if an audiometer test were relied upon in choosing cases for otoscopy Moreover, some of the cases of otitis externa discovered in the course of this investigation showed a thin discharge which might have been diagnosed as otorrhoea had not otoscopy revealed a normal drum

On the whole, even if all education authorities could afford to provide gramophone audiometers, it seems desirable that every child at routine inspection should still be given an otoscopic examination, for, granting the great value of the audiometer in detecting cases of impaired hearing, it is yet doubtful whether the very slight saving of time that would result from otoscopy of only a chosen fraction would compensate for the occasional cases of middle-ear disease and also those of otitis externa that would be missed by this procedure

Summary

In a mixed urban and rural district of Surrey, and in the city of Oxford, a comparison between the prevalence of middle ear disease in elementary school children as estimated by the ordinary procedure of routine medical inspection, and the prevalence as assessed by the same procedure with the addition of otoscopy, resulted in the latter system showing an incidence about three times greater than that given by the former, and for each area the difference is statistically significant

In the particular case of ' otitis media requiring treatment the Surrey children with a slightly unfavourable age distribution show a prevalence slightly over, the Oxford children slightly under, and the children of both areas together almost exactly ten times the incidence recorded by the Board of Education in the results of ordinary routine medical inspection throughout the country

I desire to express my thanks to Dr J Ferguson county medical officer for Surrey and to Dr G C Williams medical officer of health for Oxford for permission to publish the results of this investigation

Deaths are mainly due to associated disease often in elderly people One fatal case was that of a premature marasmic baby aged 7 days who died within twenty four hours of being admitted to hospital The majority of the fatal cases in the ultra violet light group received treatment with sulphanilamide owing to their severely ill condition Comparative figures are therefore impossible

Toxicity

In our last report only two cases of mild and transient cyanosis were noted There the average dose of prontosil 'red was 5 grammes and the maximum dosage received by any case was 15 grammes In the present series the average dosage of sulphanilamide during the first two days was 14 64 grammes and the average total dosage per case 41 6 grammes given in 14 4 days There was a considerable incidence of toxic phenomena

Cyanosis was present lasting from one to five days in thirty five cases and for more than five days in five cases, two of the latter were proved to be due to sulphaemoglobinaemia, the estimations for which were made by Dr Eaton biochemist, of Victoria Infirmary There was a total percentage incidence of 29 6 Severe vomiting necessitating stoppage of the drug occurred in two cases (1.5 per cent) toxic eruptions in three cases (2 2 per cent), and drug fever in three cases (2 2 per cent) (Drug fever is noted by Hageman and Blake (1937), and implies fever associated with the giving of sulphanilamide, which stops when the drug is stopped and starts when the drug is resumed) Two of the three cases had received only a moderate dosage of sulphanilamide In no case was any toxic effect seen which could be described as alarming

Effect of Varied Dosage of Sulphanilamide

Analysis of the previous report showed that the effect of prontosil red treatment was most marked in limiting the spread of the local condition It was hoped that if the body were flooded with sulphanilamide during the first twelve hours dramatic results might be achieved Accordingly three ranges of dosage were adopted for this period (i) 1 to 3 grammes (ii) from 3 to 6 grammes (iii) over 6 grammes Table VII shows the results obtained

TABLE VII—*Spread of Lesion with Different Doses of Sulphanilamide*

Dosage of Sulphanilamide in First 12 Hours	Duration in Days of Spread				Percentage of Cases showing Toxic Effects	Total Cases
	0	1	2	3		
1 3 grammes	34 (60 7 /)	21	1	–	19 6	56
3-6 grammes	21 (60 0 /)	13	–	1	40 0	35
More than 6 grammes	23 (58.9 /)	14	2	–	48 7	39

No evidence is forthcoming in this small series to show that greater therapeutic benefit follows the increase of sulphanilamide beyond 1 gramme given at four hourly intervals but, on the other hand an increase in toxaemia follows the raising of this dosage

Discussion

Further proof is afforded of the value of sulphanilamide in the treatment of erysipelas We would again lay stress on the difficulties attendant on drawing conclusions from the treatment of a disease so variable in its severity as erysipelas We would once more emphasize that so far as we can detect, the cases in the two groups are reasonably comparable There is no weighting of either group through duration of disease before admission to hospital, age severity of infection, or associated diseases Both groups were closely controlled in respect of diet, nursing and laxatives Our conclusions are based on statistical evidence, but we feel that the expression of clinical opinion is also relevant The results achieved in some of the cases transferred from ultra violet light treatment to sulphanilamide were most impressive It is felt that such cases which are not included in our statistical analysis, helped to demonstrate the undoubted value of the drug

As the percentages of the ultra violet light cases so closely correspond in the two reports comparison of sulphanilamide with prontosil "red' might seem permissible This however, is invalidated by the fact that the amounts used of the two drugs are not comparable The increased incidence of cyanosis in this series as compared with the original one is noteworthy and is probably associated with the increased dosage used

While the question of the optimum dosage cannot at present be considered as settled we suggest that the general practitioner adopts the following regime in the treatment of erysipelas

(*a*) As a preliminary to treatment a soap and water enema should be administered and thereafter the bowels kept open by the use of liquid paraffin

(*b*) One gramme of sulphanilamide should be given at four hourly intervals until the temperature becomes normal provided no toxic symptoms appear

(*c*) 0 75 gramme of sulphanilamide should then be given thrice daily for a further period of ten days

Conclusions

1 A series of 270 cases of erysipelas was treated under controlled conditions with (*a*) ultra violet light, (*b*) sulphanilamide

2 There was an even distribution of the individual cases in the treatment groups in respect of factors known to influence the course of the disease such as (*a*) the duration of the disease before admission to hospital (*b*) the age of the patient (*c*) the severity of the infection, (*d*) associated diseases

3 The average total case dosage of sulphanilamide was 41 6 grammes, given in 14 4 days The drug was administered in 1- 2- or 3 gramme doses four-hourly until the cessation of primary pyrexia with an average case dosage of 14 64 grammes, thereafter 0 75 gramme was given thrice daily until the case was dismissed

4 Cyanosis occurred in 29 6 per cent of cases it was more frequent when the larger doses of sulphanilamide were given

5 Sulphanilamide is of benefit in securing curtailment of (i) the duration of the spread of the lesion (ii) the duration of primary pyrexia (iii) the duration of toxaemia

6 The administration of sulphanilamide reduced the incidence of complications and diminished the tendency to recurrence

7 An effective method of treatment is to give 1 gramme of sulphanilamide by mouth at four hourly intervals until the cessation of primary pyrexia and thereafter 0 75 gramme by mouth thrice daily until final cure is determined

We wish to thank Dr W M Elliott for permission to carry out the investigation

Clinical Memoranda

Subcutaneous Emphysema Arising During Labour

An occurrence of subcutaneous emphysema during labour was recently observed in the Jewish Maternity Hospital In 1927 C A Gordon published 130 cases collected from the literature, since then only twelve more cases have been recorded

CASE REPORT

Mrs B aged 29 one para was admitted to the hospital on March 23 1936 at 7 45 p m with ruptured membranes According to her dates she was due on April 3 The pregnancy had been normal as were the heart and lungs Pulse and temperature were also normal the blood pressure was 120/65 and the urine showed nothing abnormal External measurements were average and the head engaged in the right occipito posterior position On admission she had no pains and some liquor was draining away Per vaginam the

external os admitted the tip of the finger A full preparation was given The patient said she had had a stuffy nose for the last few days

On March 24 slight pains occurred during the night and morning, these becoming stronger at 2 p m They were fairly strong during the night of the 25th though the patient did not strain more than is usual At 6 a m she suddenly complained of difficulty in opening her right eye The nurse then noticed that it was closed Within a few minutes the left eye also closed and more slowly a swelling appeared spreading over the face as far down as the lower jaw The patient was somewhat restless because of her difficulty in opening her eyes but otherwise felt quite well there was no cough or dyspnoea, only a feeling of tension over the face

It was not at that period possible to make out the typical sensation of crepitation or crackling which could not be got until about 10 a m The blood pressure was then 120/60 and the urine still normal The swelling had now spread down to the neck and the subjective condition of the patient was as before but the face was a trifle tender The cervix was nearly fully dilated and the head deep in the pelvis but still in a posterior position At 3 p m the emphysema had spread further down and covered the shoulders the upper part of the neck the upper part of the chest as far as the breasts and the right arm to the elbow joint The foetal head had descended to the perineum but there was no further advance so it was decided to deliver by forceps The child a full term boy cried lustily soon after birth of the head The third stage was normal A photograph of the patient was taken twenty four hours after the first appearance of the emphysema By then she was already able to keep the eyelids just apart from one another There was no further extension of the swelling beyond the parts mentioned The puerperium was uneventful the emphysema gradually disappeared and was not noticeable after the ninth day The mother and her baby were discharged on the twelfth day Only once before has a photograph of a case been published—by Kosmak (1907)

The aetiology of the condition in these cases is, according to Gordon, not definitely known, but he says it may occur in any part of the air passages Whereas some authors hold that it arises as interstitial emphysema from the rupture of some air vesicles, others have reported cases which support the theory that the air finds its way into the tissues from the nose or the sinuses There is not enough space here to give more than the names of these authors Dickson (1928), Martin (1928), Viana (1907), Hermann (1904) Experiments on the cadaver by Watson (1905) also seem to point in the same direction Perhaps one day we shall know more about how this rare and fortunately only dangerous looking complication of labour is brought on

I am greatly indebted to Mr J V O Sullivan for permission to publish the notes of this case

Volvulus Shortly After Delivery

Volvulus occurring as a complication of pregnancy is not very rare, cases being reported by Basden (1934), Ridler (1935), Kornfeld and Daichman (1934) and others Jellinghaus (1932) records a case following Caesarean section but I have not been able to find another one arising during the early puerperium The details of the following case may be worth reporting

HISTORY

A woman aged 40 was admitted to hospital as a case of failed forceps She had had a tuberculous left hip on which arthrodesis had been performed in childhood, and had undergone cholecystectomy in 1924 with considerable post-operative suppuration Two previous pregnancies the second in 1930 (twins) had been normal except for considerable vomiting after delivery The present pregnancy had also been normal until the starting of labour forty eight hours before admission An attempt to apply forceps having failed the patient was admitted to hospital

When I first saw her shortly after admission her general condition was good temperature 98 and pulse rate 100 She was very obese The foetus was lying in the vertex position the foetal heart could be heard and was normal the pains were poor Per vaginam the os was four fingers dilated An injection of morphine 1/4 grain was given and the patient had several hours sleep On awaking the pains restarted and improved the os dilated fully and the head advanced well but was held up at the pelvic outlet owing to incomplete rotation Chloroform and ether followed by open ether was given the head was rotated manually and delivery was easily effected with low forceps. The child was a healthy full time female weighing 7 lb 6 oz. The length of the second stage was one hour thirty minutes The placenta and membranes followed normally in fifteen minutes and the total haemorrhage was 5 oz. The mother's condition after delivery was good temperature 98 6 pulse rate 90

First Day of Puerperium—Temperature 98 pulse 100 general condition good lochia normal The patient complained of no pain but there was a good deal of vomiting of bile stained fluid in view of which a small turpentine enema was given with a poor result

PARA-BENZYLAMINOBENZENESULPHONAMIDE IN THE TREATMENT OF SCARLET FEVER

BY

J C HOGARTH, M B, Ch B Glas

Assistant Medical Officer Eastern (L C C) Hospital

Since the publication of the work of Colebrooke and Kenny (1936) and others describing the curative action of the hydrochloride of 4'-sulphamido-2,4-diaminoazobenzol or *prontosil* on infections caused by the haemolytic streptococcus it has been shown that this activity is due to the reduction products—the sulphonamides (Buttle, Gray, and Stephenson, 1936, Colebrooke, Buttle, and O'Meara, 1936, Long and Bliss, 1937) It is suggested that this reduction of prontosil takes place in the animal body, and Fuller (1937) has isolated sulphonamide from the urine of mice and human subjects four to six hours after the dose was given He also found a sulphonamide in the blood of one patient being treated with prontosil, and suggested that reduction may occur in the intestine after absorption into the stomach (Fuller, 1937, Marshall, Emerson, and Cutting, 1937) The results of a large amount of work have been published showing the beneficial effect of the sulphonamides in haemolytic streptococcal infections, the majority of the investigators using the reduction product para-aminobenzenesulphonamide (Snodgrass and Anderson, 1937, Purdie and Fry, 1937, Breen and Taylor, 1937, Fleming, 1937, Foulis and Barr, 1937, Proom, 1937, Weinberg, Mellon, and Shinn, 1937, Anderson, 1937, Robinson, 1937, Vitenson and Konstam, 1937, Blair, 1937, Salama, 1937, Frazer, 1937)

A considerable number of reports have put on record the occurrence of toxic complications following the administration of the drug Most common among these complications are sulphaemoglobinaemia, methaemoglobinaemia, acute haemolytic anaemia, acidosis, and agranulocytosis Two fatal cases of the latter are reported (Kenny and others, 1937, Harvey and Janeway, 1937, Discombe, 1937, Paton and Eaton, 1937, 1937a, Hammond, 1937, Borst, 1937, Model, 1937, Southworth, 1937, Whitby, 1937) These serious complications were noted so frequently that Colebrooke was prompted to publish an appeal to investigators to give sulphonamides with care At the time when the work reported below was started another derivative of prontosil was available for use—namely, para-benzylaminobenzenesulphonamide This substance was stated to be less toxic than any other reduction product of prontosil, though it retained the curative properties It was accordingly chosen as the most suitable substance for use in a series of cases in which the majority would probably be young children suffering from a relatively innocuous streptococcal infection This belief appears to have been borne out, as comparatively few complications following its use have been published One fatal case of agranulocytosis is recorded and one case of sulphaemoglobinaemia where it was given in conjunction with prontosil (Model, 1937, Frost, 1937) Whitby (1937) concludes that while it is much less likely to produce sulphaemoglobinaemia or methaemoglobinaemia, it is equally effective against the haemolytic streptococcus

Plan of Investigation

The object of this investigation, which lasted from July, 1936, to May, 1937, was to find the effect, if any, of para-benzylaminobenzenesulphonamide on the toxic and invasive features of scarlet fever The cases, which total 356, were divided into three groups—I, II, and III The first group received no special treatment, the second were given anti-scarlatinal serum intramuscularly, the morning after admission, in doses varying from 10 to 30 c cm according to the severity of the case, the third group were given serum in similar doses to the above, together with para-benzylaminobenzenesulphonamide in the doses noted later

To ensure uniformity, treatment was not instituted until I had seen and graded the cases This entailed deferring the administration of the drug and serum until the morning after admission In order further to eliminate variable factors as much as possible the following measures were taken The cases were allotted to the three groups in strict rotation In each ward in which the investigations were conducted the groups received the same nursing attention—a factor which may be of some importance As all the cases were admitted during the same period the seasonal factor was eliminated All cases were under the care of the same medical officer, who made an assessment of the severity of each case and an examination for the presence of complications All doubtful cases and cases of surgical scarlet fever were excluded from the series

Dosage of Sulphonamide

Cases under 5 years of age were given 0 5 gramme twice daily for three days, then 0 5 gramme once daily for four days, and from the sixteenth day 0 5 gramme once daily for seven days Cases over 5 years of age received 0 5 gramme thrice daily for three days, then 0 5 gramme twice daily for four days, and from the sixteenth day 0 5 gramme twice daily for seven days The object of giving the doses in two periods of the illness was to cover the toxic period and the time when complications most commonly occur

In calculating the duration of the pyrexia the day of admission was counted as one day, whether the patient was admitted in the morning or the evening The initial pyrexia was arbitrarily regarded as having terminated the first time the temperature remained normal for twenty-four hours or more The severity of each case was gauged from the pyrexia, the angina, the brightness of the rash, and the toxic condition of the patient It should be noted that throughout the investigation the average standard of severity was low, even those cases grouped under the heading 'moderate to severe' being mild when compared with cases of previous years

Details of the Complications

As the personal element enters more than ever into the definition of the various complications the following details are given

Whitlow—This term includes all sepsis of fingers or toes

Rheumatism—Cases showing the typical signs of acute rheumatism were included under this heading The three cases recorded responded well to salicylates and two had family histories of rheumatism

Myocarditis—This term includes all cases in which there was pathological irregularity or any indication of weakness of the cardiac muscle

Endocarditis—The only case recorded occurred in one of the children who developed acute rheumatism

Otitis Media—Taken to be indicated when the drum head was found to be inflamed or the ear discharged Actually all those noted to be inflamed subsequently discharged

Second Day—Temperature 99 4°, pulse 108 general condition good and patient comfortable with no pain, but vomiting of bile stained fluid still continued She stated that she had vomited 'just like this after a previous anaesthetic After a stomach wash with sodium bicarbonate the patient ceased vomiting and took and retained some solid food It seems probable that the volvulus had occurred by this time In the evening the temperature was 99° and pulse rate 120, the lochia were unpleasant As there was some distension a large enema was given, with a good result, the stools being rather clay-coloured

Third Day—Temperature 100 4°, pulse 140, general condition less good Vomiting started again, the vomitus being unpleasant, and for the first time the patient complained of mild colicky pain and flatulence On abdominal examination no tenderness or other abnormality was found Up to this time attention had been focused more on the chances of uterine infection following the operative intervention before and during delivery but as the symptoms pointed more to an intra-abdominal condition a surgeon was consulted, and he advised laparotomy A spinal anaesthetic was given, but the patient collapsed and died

POST MORTEM EXAMINATION

A volvulus of three quarters of a complete turn of the greater part of the small gut from the ileo-caecal valve upwards was found There were no adhesions between gut and liver and the gall-bladder was absent There were signs of infection of the cervix, but the body of the uterus and the placental site were normal

COMMENTARY

In view of the rapid change of position of the intestines after delivery of a full-time child it is perhaps surprising that volvulus does not happen more frequently In this case the volvulus probably occurred shortly after delivery, and too much attention was paid to the possibility of uterine infection This case also supports the dictum that during pregnancy and the puerperium there should not be too much delay in performing laparotomy in doubtful cases

I would like to express my thanks to Dr W D Sturrock, physician in charge of the department for permission to publish this case and to Dr P Mallam who performed the post-mortem examination

An Unusual Manifestation of Hypoglycaemia

The remarkable character and long persistence of what was apparently a hypoglycaemic attack renders a recent experience worthy of record

CASE RECORD

The patient a male now aged 48 years had an interesting diabetic history Glycosuria was discovered in 1920 His weight had dropped from 13 to 8 stone He was one of the first Australian diabetics to receive insulin He dispensed with medical assistance almost entirely as soon as he had been instructed in the method of administration and for twelve years has varied his dosage according to his own physiological convictions He stated that he could tell when he was glycosuric without having to test his urine! At first he took up to 75 units daily and latterly had been in the habit of giving himself one injection of 40 units daily He admitted that he had fairly often experienced minor insulin attacks of the usual description also one seizure of the nature described below about a year previously from which, however, he made a quick recovery on taking some sugar His diet since 1920 has actually been proportionately high in carbohydrate

During the whole of this period up to the present time this man has been a keen amateur wrestler He claims to be the 'world's champion diabetic athlete' For several years he held the amateur wrestling championship of Australia, and was runner up in 1928

Those acquainted with the manner of wrestling in Australia whether amateur or professional, will realize what a strenuous and exhausting process it is It calls for strength and endurance comparable to that required by long-distance bicycle riders and by marathon runners, so that this patient must have learned to make large variations in his insulin intake according to his projected degree of activity—

His experiences on the day of his major attack are described in his own words as follows

I was in the habit of taking 1 c cm of U 40 in one injection daily and can generally tell without testing if showing sugar Believing this to be the case on Wednesday night, I took an extra 16 units of insulin, and then 36 on Thursday morning at 7 15 At 9 30 a m I found that I could not say *what I wished*, so sent out for a threepenny cake of chocolate—followed in ten minutes by another No result so ate a large apple (This is the first time I have tasted sweets in sixteen years but the shock was so sudden that I thought it merited it) Still no result so was taken home at 11 30 a m tested and found no sugar, ate four sao biscuits and some sugared coffee in addition to some steak and tomatoes I tested again at 2 30 p m and found heavy sugar, and took 20 units of insulin It was after that I was taken to you I was able to understand most things but could not express my thoughts

'On arriving home I immediately took another 20 units of insulin and went to bed had tea at 6 o clock showed clear of sugar at 7 o clock and was practically normal at 8 o clock

I had a slight aphasia turn just twelve months ago but only of one hour's duration, but have often of course had slight hypoglycaemias

He was brought to the clinic for observation by Dr Gordon Robertson about 4 30 p m He appeared to understand everything that was said to him and in his hearing and at times could say "Yes and 'No" but usually as he attempted to put two words together he would only succeed in reiterating x x double x He appeared annoyed at his failure to express himself He was given a pad and pencil but only succeeded in producing a number of hieroglyphics containing an odd recognizable letter On examination he looked perfectly well, had a dry skin, and was of a good colour and able to walk about normally He realized his surroundings and recognized his family He was right handed but absolutely no sign existed of any derangement in his left motor cortex or in his capacity to co-ordinate movement No tremor even of the finest grade was present His urine was loaded with sugar but contained no acetone He would not wait even for a blood sugar test to be made, but insisted on being taken home On reaching home as stated above he took another 20 units of insulin! About 9 p m—that is, about twelve hours after its onset—the aphasia began to improve and passed off gradually The following morning he rang me up and was then in perfect control of his speech and ideas

COMMENTARY

Apparently the degree of hypoglycaemia was low enough to injure his cortical cells to such an extent that it required nearly twelve hours for them to recover, even though bathed in plasma containing a sufficiency of glucose The analogy with certain instances of cerebral anoxaemia—for example, carbon monoxide poisoning—is close This is the longest seizure in my experience, and also illustrates the curious phenomenon that attacks of a single nature—for instance, tremor, psychic change, or syncope—will recur in the same subject as an individual idiosyncrasy, and rarely change their type

Reviews

THE LAW OF FOOD AND DRUGS

Bell's Sale of Food and Drugs By R. A Robinson Ninth edition (Pp 321 22 tables 15s net) London Butterworth and Co 1937

The law which governs the sale of food by weight and its adulteration has become very voluminous and puzzling as social life has become more complicated Not the least of the sources of complication are the statutes relating to milk and the orders which have been made under them The Merchandise Marks Act has introduced another whole chapter of law, and the great expansion of the science of commercial chemistry has enriched the ingenuity of the adulterator *Bell's Sale of Food and Drugs* was first published in 1886, and his learned successors have kept this classic up to date Mr Robinson, the author of the ninth edition, not only has great legal experience of the law of food and drugs, but as chief officer of the Public Control Department of the Middlesex County Council administers it in practice He has produced a book which will be invaluable to local authority officers and also to those who sell food All the relevant statutes and regulations are printed section by section with notes, and the recent decisions of the courts have been summarized and incorporated Two good features are a bibliography of official publications and the reproduction of a number of circulars and memoranda to local authorities There is also a useful appendix on the commoner forms of adulteration In addition to the usual citation of the decided cases in the various series of legal reports, Mr Robinson also gives the reference to the note of each case in *Butterworth's English and Empire Digest* and his references to Public Acts are each followed by a reference to the appropriate page in *Halsbury's Statutes* These two great textbooks are now an indispensable part of the lawyer's equipment, and reference to them saves much time The volume is light and attractively arranged and printed, as are most law books nowadays

PRINCIPLES OF PHARMACOLOGY

Handbuch der Experimentellen Pharmakologie Supplementary Volumes. Edited by W Heubner and J Schüller Vol. IV *General Pharmacology* By A J Clark (Pp 228 79 figures RM 24) Berlin Julius Springer 1937

In the past pharmacology has been largely empirical A great deal of painstaking work has led to the discovery of general principles which have often been only vaguely formulated, but which have had great practical importance since they have led to the manufacture of hundreds of synthetic products many of which have powerful actions, both therapeutic and toxic In recent years the proper scope of pharmacology has been increased by the synthesis of numerous hormones and vitamins and artificial products of similar structure Comparatively little work in these fields has been done in this country where pharmacological departments are so poorly endowed, and so understaffed that they cannot do much more than carry out the routine teaching of medical students

One reason for this neglect of pharmacology is that it has been despised as a science which has not yet passed the stage of pure empiricism The time has now come, however when it is possible to formulate general principles This has been done by Professor A J Clark in a monograph which is published in English as part of one of the supplementary volumes of Heffter's *Handbuch* In this monograph he discusses such questions as the relation between the concentration of a drug and the time it takes to act the relation between concentration and effect individual variation of the sensitivity of man and animals, drug antagonisms, and other pharmacological problems in which quantitative results have been obtained

The book contains a rich medley of facts, and must be based on a wide knowledge of many branches of scientific literature Tobacco leaves and insects, mice and men, are all shown to follow the same laws of variation Studies of photographic plates are found to present the same problems as studies of plain muscle Phenol obeys the same laws whether it is acting on protein molecules or bacteria Calculations based on the action of drugs on plain muscle are used to explain the action of drugs on enzymes, and vice versa The account of the action of drugs on enzymes is one of the most interesting features of the book It seems likely that such studies will illuminate many of the obscure places in pharmacology

There is evidence that the monograph has been hurriedly prepared The misprints are probably due to the activities of foreign compositors, but there are errors which cannot be explained in this way For example, the term 'normal equivalent deviation" is correctly expounded (p 146) but incorrectly used (pp 170–2) There is much repetition and some careless writing, but yet this is a great book, and no one else could have written it The only important branch of pharmacology which is not discussed is the relation between chemical structure and pharmacological action This is a large subject, which deserves a monograph of its own It is to be hoped that someone will soon do for this branch of knowledge what Professor Clark has done for the rest of pharmacology

THE LONDON SURGEONS' COMPANY

The History of the Surgeons Company 1745–1800 By Cecil Wall, M.A D M F R C.P With a foreword by Sir D Arcy Power K B E. (Pp 256 with frontispiece and 9 other illustrations 10s 6d) London Hutchinson's Scientific and Technical Publications 1937

Dr Cecil Wall has done a useful piece of work in telling the story of the London Surgeons Company, which began in 1745 and ended unmourned and officially in 1796 The history is the outcome of the Vicary Lecture given in 1935, and that lecture is a token of friendship, showing that there is an end of the feud existing between the Company of Barbers and the Corporation of Surgeons Very little has hitherto been known of the period dealt with by Dr Wall A small and impecunious guild of skilled Surgeons was absorbed by a flourishing Company of Barbers practising minor surgery in 1540 The union lasted more or less harmoniously until 1745 The surgeons became better educated and had gained some scientific knowledge the barbers acting as their business allies Men like Wiseman, Cheselden, and Percivall Pott were of a high type socially as well as intellectually they wished to make their occupation a profession Other members desired to be known as surgeons rather than to be attached to a body which contained many barbers The difficulty of the alliance was especially felt by those serving in the Navy and Army for when they were taken prisoners their captors professed inability to determine whether they were educated surgeons or mere barbers and usually classified them as barbers The inevitable disruption occurred, and the Bill being passed by Parliament received the royal assent on May 2, 1745 The surgeons were formed into a new organization retaining permission to use the bodies of four felons for anatomical

a wide choice but 1 in 1,000 solution of biniodide of mercury in industrial spirit is a very suitable one This technique is of course safer if the operator takes care to avoid contamination of his hands by wearing gloves in all septic cases Suitable gloves are, however, so cheap now that they may with advantage be worn in all cases where incisions into uninfected tissue are made They are best sterilized by boiling but in an emergency they may be first put on then well washed in soap and water, and finally dipped in a strong antiseptic solution for a few minutes Pure dettol and lysol are recommended for this purpose but they tend to leave the gloves inconveniently slippery, the spirituous solution mentioned above is quite satisfactory and when the spirit has evaporated, leaves the gloves dry

With the equipment outlined here I feel sure the practitioner can face the minor surgical problems of his work with equanimity As the necessity arises he can slowly add to his initial stock of instruments until he has an outfit which might rival that to be found in the out-patient theatre of a hospital

THE CAMPAIGN AGAINST CANCER

RECORD OF A YEAR'S WORK

The annual general meeting of the British Empire Cancer Campaign was held at the House of Lords on November 30 with the DUKE OF GLOUCESTER president of the Campaign in the chair

In a brief address His Royal Highness referred to the interest of the Royal Family, including Edward VII, George V, and the present King in the fight to conquer cancer It was a source of satisfaction to him to feel that he was able to carry on the family tradition No one could fail to be impressed by the extraordinary field that was being covered by the researches associated with the Campaign in every part of the British Empire One important activity was the periodical conferences which were arranged between the laboratory and clinical investigators of the country, he understood that about 300 such workers met together from time to time to discuss informally and privately their respective problems He had also been interested to hear that in Australia the Commonwealth Government convened at frequent intervals conferences of delegates from all its States and from New Zealand to consider the cancer problem The Grand Council would have before it at the meeting which was to follow a request for affiliation to the Campaign from the Victoria Anti Cancer Council of Australia which meant that another of the principal research centres of the Empire would be linked to the research organizations of the mother country At that same meeting and in January the Grand Council would be asked to vote a total sum of £43 000 for the support of cancer research in the year 1938 He knew that at a time when heavy demands were being made in all directions for charitable help from the British public the provision of such large sums must entail great efforts on the part of the voluntary helpers He thanked these helpers and the subscribers for their services

Lord HAILSHAM who later was re-elected Chairman of the Grand Council thanked His Royal Highness and spoke of the encouragement which all the workers derived from the abundant sympathy of the Royal House

Recent Investigations

Lord HORDER chairman of the Scientific Advisory Committee of the Campaign in presenting the annual report, asked that it should be borne in mind that although research into the cause and cure of cancer was the specific aim and object, cancer research was but a branch of general medical research From time to time important data emerged from cancer research which were of great value in the general problems of medicine, and on the other hand many discoveries were made by those engaged in general medical research which were of material benefit to the work on the cancer problem He drew special attention to two pieces of work, the one by Dr Alexander Haddow carried out at the Royal Cancer Hospital, and the other by Professor W E Curtis and Dr F Dickens under the auspices of the North of England Branch of the Campaign With regard to the first it appeared from the report that the application to animals of very minute doses of dibenzanthracene and other cancer-producing chemicals would actually cause a definite regression and in some cases a complete disappearance of tumours present in the animals Such a phenomenon was not uncommon in medicine When taken in small doses a good many substances acted as remedies which, if taken in larger doses, gave far from beneficial results to the patient Whether this experimental work would be of use eventually as suggesting a form of curative agency could not at present be said but the observation quoted was surely a matter of great interest and one that might lead to results of far-reaching importance

Action of Ultra short Wireless Waves

The other work (Lord Horder continued) was equally suggestive In spite of the unceasing search for new forms of treatment, surgery and x rays and radium still remained the principal methods available Every line of research which gave promise of supplementing these standard treatments received full and careful consideration by the Campaign An important recent development of this kind was the inquiry now being carried out in Newcastle into the action of ultra short wireless waves The present results of this examination had demonstrated that the curative effect of these waves in the experimental treatment of cancer was brought about by the heat which they generated within the tissues The heating was of a very special character for it could be localized and controlled with an accuracy which was quite impossible before the application of the newer methods resulting from modern wireless technique Recent research had now enabled the temperature to be raised within the tumour to any desired level, and to be kept there as long as was required Thus one of the older weapons against cancer—the cautery—was being revived, but in a form incomparably less drastic and more refined One of the most interesting features of this investigation was that it had revealed some unsuspected resemblances between the action of heat and that of radium

Lord Horder added that another aspect of the Campaign's work was inaugurated last year—namely, clinical cancer research In London alone the investigations, which would be in the hands of physicians and surgeons of the many contributing institutions would extend over more than 17 000 fresh cases of cancer each year

In seconding the adoption of the report, Mr EDWIN FISHER a member of the Finance Committee mentioned that during its last financial year the Campaign received just over £67 000 It made grants of over £34 000 to the research departments of the national hospitals and a sum of over £11 000 was refunded to the provincial branches of the Campaign to assist them in the fight they were making against cancer in their respective areas

The Annual Report

The fourteenth annual report of the Campaign some of the principal points in which were touched upon by Lord Horder in his speech is a document of 250 pages, and includes progress reports from more than twenty research departments in this country and seven over seas as well as from the individual researchers whose work has been approved by the Scientific Advisory Committee Mr J P Lockhart-Mummery who has edited every report since the

teaching and the Arris and Gale bequests of £510 and £16 each respectively, while the barbers remained as of old (and as they still are) one of the City Companies, keeping the Hall in which they met, with most of its valuable contents and the revenues

The new Corporation of Surgeons had to begin life in a very poor way It had, indeed, the rights of teaching and of licensing surgeons both for private practice and for service under the Crown, but it had comparatively few members, no common meeting-place, and very little money Dr Wall details the progress it made, and it was unedifying The leading surgeons were too busy to interest themselves in the new Corporation, the teachers found that it paid them better to establish private schools than to give public lectures, and the members were not punctual in paying their quarterages There was a general slackness in the conduct of affairs, and irregularity of procedure on several occasions culminated in the dissolution of the Corporation Attempts were made to re establish it by Act of Parliament, but the Bill was rejected on July 17, 1797, and eventually the College of Surgeons of England was founded by the grant of a Royal Charter on March 22, 1800 Two good things were done by the defunct Corporation it secured the nucleus of the Hunterian Museum and it bought the site in Lincoln's Inn Fields upon which the present College of Surgeons was built

All this Dr Wall tells in detail, and he adds seven valuable appendices containing dates and figures which it is hard otherwise to come by There are also nine illustrations, of which the most interesting is the famous picture by Holbein showing King Henry VIII delivering a document to the United Company of Barber Surgeons, and side by side with it the copy of it made before the Great Fire, which has been recently restored and now hangs in the Hall of the College A sufficient bibliography, a good index, and a foreword by Sir D Arcy Power complete a very satisfactory volume which will be of great use to medical historians

COOKERY FOR WORKERS' WIVES

Dr Nash's Cookery Book By Elwin H T Nash (Pp 183 6d net.) London Simpkin Marshall Ltd 1937

No one will deny that while much of the malnutrition that exists to-day is due to poverty some is also due to a lack of knowledge on the part of working-class wives of how to buy to the best advantage and how to prepare and cook the food to obtain the maximum of nourishment and enjoyment from the day's meals This is no small part of the whole problem of the nutrition of the working classes, yet few practical attempts at dealing with it have appeared in print. Such an attempt has, however, recently been made, and the very successful results are embodied in a sixpenny book entitled *Dr Nash's Cookery Book*

For the last two years Dr Elwin Nash, medical officer of health for Heston and Isleworth, has been conducting an investigation into the extent to which it is possible to provide first-class protein in the diet of the working classes and yet not exceed the income available for food Assisted by a dietitian and two cooks Dr Nash (who admits to many years of experience of cooking as a hobby) has produced some 300 recipes a very large proportion of which are entirely new He has endeavoured to show that palatability can be achieved though prices paid for beef averaged 6d per lb, for mutton 3d, and the bacon used throughout was nearly always scrap bacon," the machine trimmings of the tidy rasher which could be bought for 2d to 4d a pound One glance at his recipes will suffice to indicate how successful he has been He also emphasizes the digestive superiority of food cooked in deep fat "People recognize," he states, "the palatability of fish and chips cooked by this method but they practically never attempt to apply it to cooking in their own homes" Food fried in shallow fat—Dr Nash gives rissoles as an example—is found when cooked to be saturated throughout with grease, whereas the same article cooked in deep fat is crisp and dry when drained and inside is entirely free from grease

It is difficult to make any selection for review purposes from these recipes, since all are new and all are nourishing and at the same time represent very tasty dishes Among the fish dishes there is a haddock and cheese turnover and a fish chowdar, among the cooked meat dishes a shepherd's pie with sausage among the savoury meat dishes a liver and bacon roly-poly, and among the puddings a plum charlotte pie—random examples, but sufficient to show the unusual and appetizing meals Dr Nash has planned Not only have the ingredients in all these recipes cost less than those commonly used but the utensils with two exceptions were bought at a sixpenny store

The book is well printed, the recipes being clearly set out, and Dr Nash has prefaced it with some excellent advice on the general principles of steaming, stewing, frying, etc The research which has resulted in such a successful production was only made possible by a grant of £500 from the Carnegie Trustees and some financial help from the local authority Altogether a very good cookery book for the workers' wives

PULMONARY TUBERCULOSIS IN PRACTICE

Pulmonary Tuberculosis in Practice A Modern Conception By R C Wingfield, B A M B B Ch F R C P (Pp 122, 25 figures, 1 plate 9s net) London Edward Arnold and Co 1937

Though several factors are probably responsible for the dissatisfaction widely expressed in regard to the diagnosis and treatment of pulmonary tuberculosis, there is little doubt that only with the co operation of the general practitioner will improvement follow The administrative aspect of tuberculosis control has, superficially at all events, so advanced in this country that the ordinary physician may well drop the tuberculous person like hot coals and leave him to the State The general practitioner, however, cannot wash his hands of his tuberculous patients, it is he who must guide them when they have left the sanatorium after obtaining the maximum benefit from institutional treatment Moreover, just as it is important to diagnose phthisis at an early—treatable—phase, the phase of inconspicuous symptoms, so it is equally important not to subject a person with a healed or non progressive lesion to prolonged institutional treatment Correct assessment of the lesion must be a *sine qua non* of the diagnosis Dr Wingfield, whose long experience of the treatment of phthisis in adults enables him to speak with authority, therefore deserves our gratitude for attempting 'to bridge the gap between the practitioner and the specialist his small book contains teachings which should help to secure both early diagnosis and the correct handling of the vast number of people suffering from pulmonary tuberculosis in its different clinical forms This intrinsic value of the book is admitted in spite of the criticisms which follow

It is perhaps inevitable that the production of a simplified conception, a working hypothesis, should lead to statements that would not always be borne out by pathological evidence Again, the role assigned to

first contributes an interesting preface Cancer research proceeds along a widely extended front, but it is an unequal progress, and it would be idle to pretend that all the work has the same merit Yet it must all be recorded, lest discouragement be given in some obscure quarter and of course there is always the possibility that work which was unpromising or which appeared to be detached from the main line of traffic may suddenly prove to be of great value

The study of growth is being pursued by many research workers and has been helped during the year by the discovery in the Physiological Laboratory at Cambridge of an experimental method whereby the growth-promoting activity of adult tissue extracts can be measured and compared by means of cinematograph films of cultures of living cells *in vitro* The method consists of making photographs at frequent intervals and estimating the percentage of the cells present which divide per hour Of the adult tissue extracts so far investigated those of the thymus gland and testis have been found to be most active On the other hand, and contrary to expectation, spleen extracts do not stimulate growth The effects produced by the injection of oestrogenic hormone into animals have been studied in the Department of Experimental Pathology University of Leeds and it has been found that this hormone acts in certain circumstances as an intrinsic carcinogenic agent If female mice of a special strain naturally resistant to the development of spontaneous tumours are treated by injections of oestrogenic hormone combined with prolactin they may develop mammary carcinoma Further studies of the Rous fowl sarcoma undertaken at the Courtauld Institute of Biochemistry, Middlesex Hospital and at the Lister Institute, have yielded valuable information regarding the nature of the tumour exciting agent Various experiments recorded add considerable support to the view that the Rous agent instead of being a lipoid substance as recently claimed, is a protein

Carcinogenic Agents

Work at the Royal Cancer Hospital on cancer-producing compounds has continued, and it has now been proved that carcinogenic hydrocarbons differ from other chemical substances known to interfere with growth in respect of the prolonged character of the retardation produced by a single injection Many different types of tumour have now been produced by the application of carcinogenic agents these include tumours of skin and lung and both sarcoma and adenocarcinoma Lately it has been found possible to produce tumours of the internal organs such as liver by *o* amido-azo-toluol and this work, also done at the Royal Cancer Hospital has suggested a possible relationship between diet and cancer It is suggested that the prevalence of primary cancer of the liver in such places as Java may be connected with the highly spiced foods consumed there

In the cancer research department at St Mark's Hospital a further study of the histological grading of tumours has been made and this study now covers a series of over 600 malignant growths of the rectum A definite relationship has been shown to exist between the grade of any particular malignant growth and its likelihood of recurrence after operation Prognosis as regards cure by operation in cancer of the rectum can now be judged with greater accuracy on the basis of histological grading The prognosis depends both upon the extent of the spread of the tumour at the time of operation and upon the grade into which the particular tumour falls A report from the biochemical laboratories of the General Hospital and University Birmingham concerns the correlation of histological features and hormone excretion in cases of tumour of the testis In thirteen cases of testicular tumour positive Aschheim-Zondek reactions were obtained in only three patients In two of these the reaction became negative after removal of the tumour, but in the third the hormone excretion continued until the patient ultimately died of multiple metastases

A good deal is said in the report about radium and x rays particularly the improvement in methods of defining the dose and determining the exact position of the beams of radiation The results of treatment at very high voltages are awaited, in particular those obtained by a new apparatus designed to operate at a million volts

Geographical Distribution of Cancer

Appended to the report are a number of maps of England and Wales illustrating the incidence of cancer in certain sites of the body in various parts of the country This is the subject of an article following some similar work in the previous report, by Dr Percy Stocks medical statistical officer at the General Register Office The maps show the distribution of mortality for males aged 25 and over during the period 1921–30 following cancer of the tongue, mouth and tonsil jaw larynx, bladder and prostate Cancer of the tongue has a high mortality in the north of England with another region of high mortality just south of the Wash, a third in certain counties of South Wales and a fourth in Kent and Middlesex An area of high mortality from cancer of the mouth extends from Lancashire to Staffordshire, and from cancer of the jaw from Durham to Staffordshire, with other areas in South Wales and from Wiltshire to Devon The chief area of high mortality from cancer of the larynx is in the south-east, and the same is true of cancer of the bladder, while the area of highest mortality from cancer of the prostate lies around London

The general conclusions to be derived are not as yet fully discussed, but a single example is offered to show how great is the difference in the site incidence of cancer even between localities whose total cancer mortality is virtually the same London and Lancashire have a standard mortality ratio from cancer in all sites in males of 25 and over of 107·5 and 107·3 respectively, but the probability that cancer when it develops will appear on the skin is twice as great in Lancashire towns as in London whereas the probability that cancer will appear in the bladder or prostate is more than half as great in London as in Lancashire This supports the hypothesis that certain extrinsic factors operating through a man's environment may be of great importance in determining in what part cancer will appear whether or not the difference in site incidence has any relation to occupation remains to be determined

A map is added showing the rainfall in different parts of the country There is no proof that rainfall with its accompanying general humidity has any effect on cancer incidence, but in the problem of cancer innumerable possibilities have to be considered, carefully examined, and, oftener than not, set aside

---

The twenty-sixth annual Conference of Educational Associations will be held at University College, Gower Street London, W.C. from January 3 to 8 The Minister of Health will deliver the presidential address on 'Education and Health' on Tuesday, January 4, at 5 p.m. 'Health and Schools' will be discussed at a joint conference on January 6, at 5 p.m., with Sir Farquhar Buzzard in the chair, and it is hoped that an address will be given by Dr Horlitz of Stockholm Aspects of the question of health and the school child will be considered at a number of sectional meetings, and conferences have been arranged on the study of family problems and on vocational and educational guidance There will be special exhibits illustrating health education The book programme to be published about December 18 may be obtained from the Conference Office Gordon House 29 Gordon Square W.C.1 (price 3d post free) Season tickets price 5s., admit to lectures and exhibitions throughout the week

secondary infection is at present based almost entirely on theoretical considerations, and Dr Wingfield is indeed himself at great pains to point this out The use of certain terms, such as "secondaries" for the "early' lesions of phthisis, though perhaps permissible in a book that confines the discussion to bronchogenic phthisis, will confuse the reader who may wish to go further afield and study the evolution of tuberculosis as a general disease To the practitioner the constant repetition of terms like "cavitated open spreading fibro-caseous lesion" or "secondarily infected cavitated healed fibro-calcareous lesion," and of symbols such as T(i)Xcav or TIXcavX, will be a source of despair The reviewer himself found it necessary to read the book twice, the second time very carefully, before he could really follow the excellent reasoning and appreciate the sound common sense contained in it We believe the work will be of greater benefit to tuberculosis officers and medical officers in sanatoria than to harassed general practitioners

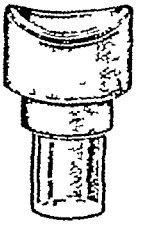
Dr Wingfield insists on frequent *x* ray control during institutional treatment and after it has been completed, particularly in order to detect relapses in the asymptomatic stage, though he is careful to stress the limitations and fallacies of the method His suggestions in regard to "after-care' are sound though they point to an experience based on the less poor classes of the population The presence of tubercle bacilli in relation to the lesions is apparently discussed from the standpoint of the examination of the sputum by the smear method Recent investigations by culture and gastric lavage methods have demonstrated the presence of bacilli in most of the early lesions described by Dr Wingfield Finally, many authorities would question the caution emphasized in the decision to induce an artificial pneumothorax in persons over 45

Dr Wingfield has written a good book, but its value will be appreciated only when he has considerably simplified the terminology

Notes on Books

A third edition of Mr H S SOUTTAR'S *Art of Surgery* has recently been published by Heinemann at 30s This book was planned and executed on original lines and it must be gratifying to the gifted author that it has found such favour with students of surgery In this edition a number of fresh illustrations have been introduced, pencil sketches by the author himself with the intention of demonstrating to the student what he should see with his mind's eye when looking at a case or a specimen These pictures are remarkable for their clarity and show at a glance the points they are intended to illustrate Incidentally they furnish still further proof of Mr Souttar's versatility for a professional illustrator might with justice feel proud of them A short appendix on the modern treatment of fractures has been added to this edition otherwise no alterations have been made in the text in fact we regret to find an obvious misprint on page 47 of the second edition repeated on page 47 of the third The student who reads this book will find instruction and pleasure combined to an unusual degree

Mr 'James Harpole has culled some leaves from his case book with the laudable intention of showing the public that the medical profession is not so black as it is sometimes painted and that medicine is not stagnant He illustrates the immense changes in treatment that have taken place in the last twenty-five years by describing some of his cases (naturally without identifying details) which emphasize the progress that has been made and which carry hope for the future He is a convinced optimist, but sometimes pulls himself up with a jerk as in the chapter entitled 'The Fountain of Youth,' which he concludes with the not unnecessary warning to his readers not to expect too much for the present His style is lively and the interest is well sustained, though the second part, "The Romance of Medicine," involves some repetition of the first part At the foot of page 75 "genes' would be more accurate than "cells' *Leaves from a Surgeon's Case-Book* would serve as a useful Christmas present for disgruntled patients It is published by Cassell and Co at 8s 6d



Dr WALTER BROMBERG'S purpose in writing *The Mind of Man* (Hamish Hamilton, 10s 6d) is, he says, to correlate the various currents of psychological knowledge in the past with present-day therapeutic work He traces the evolution of mental treatment from the common source, the cry of humanity for relief from mental distress He covers a great deal of ground the early magi, the primitive medicine men and shamans with their charms and amulets, the Greek priest physicians, folk-medicine, superstition and magic, witchcraft, the medical treatment of lunacy, faith healing hypnotism, suggestion, and the development of modern psychotherapy The summary of the tenets of the modern psychotherapeutic schools is on the whole remarkably fair and accurate, except that he makes the common mistake of accusing Jung of poetic mysticism This is an interesting book, and contains a large and useful classified bibliography

Drug Atlas for Students of Pharmacy and Medicine by Mr W SCARNELL LEAN (Longmans, Green, 2s 6d), indicates by means of a series of outline maps the sources of all the important vegetable drugs The maps show clearly many interesting points regarding the drug trade. For example the East Indies are an exceptionally important source of drugs, for not only do they supply the spices for which they originally became famous in trade, but also they are the chief sources of coca leaves and cinchona bark drugs whose original home was in South America

The Mission to Lepers (7, Bloomsbury Square W C 1) has published at 1s a booklet, *Bruised Reeds* by W H P ANDERSON In this the author tells of what he saw of the growth and development of the Mission's work on a recent visit to India and China

Preparations and Appliances

AN EYE BATH

The Irise Eye Lotion Bath illustrated herewith consists of two parts the top of rubber which is said to fit closely to the eye and prevent any leakage of the lotion, and the bottom of white glass, which is transparent and easily cleaned Further information may be obtained from the makers Messrs. W Stevens and Co 31, East Hill Wandsworth S.W

ANTISEPTIC AND ANALGESIC THROAT TABLETS

"Orax (or O R 95) throat tablets (made by the Medico Chemical Corporation of America and marketed in this country by Coates and Cooper Ltd) contain a complex organic compound with the following constitution ethyl butyl ester of diamido-diethylamido-ethyl carbamido-dicarboxy-diphenylmethane acridino-oxyquinoline ($C_{41}H_{53}N_5O_6$) This compound is stated to be an effective local anaesthetic and an antiseptic of high potency and to have a low toxicity The tablets are recommended for the treatment of sore throat, tonsilitis etc.

ALCOHOL, NUTRITION, AND FITNESS

MEDICAL ASPECTS OF A SOCIAL PROBLEM

A national conference, convened by the National Temperance League, was held at the University of London on November 30 Lord Astor (chairman of the League of Nations Mixed Committee on Nutrition), who was to have presided, was prevented by indisposition from so doing His place was taken by Mr WILLIAM CHARLES The conference had as its objective emphasis on the urgent need for a fuller recognition and consideration by all public authorities of the physical, social economic, and moral effects of the prevailing national consumption of alcoholic beverages especially in relation to the National Campaign for Nutrition and Physical Fitness

A Menace to Child Life

Professor AMY FLEMING thought it would be agreed that many prospective parents were constantly in search of knowledge as to what they could do to give their children a better chance in life than they themselves had been given It seemed certain that if they could only be made to realize that any alcohol taken by them reached the unborn child and acted as a poison 99 per cent of parents would abstain from taking alcohol Investigation had proved that alcohol was a menace to child life at all stages of the child's existence The child might sustain damage through either or both parents It had been definitely proved by the work of Dr Pertholdt and more recently Dr Weller, that excessive consumption of alcohol unfavourably modified the germ plasm and much evidence had been produced by investigators who had not commenced their work in order to study alcohol but in order to study the germ plasm itself There was some evidence that alcohol in excess might soon be proved to produce a change in the germ plasm which would be transmitted to the third generation The parental stages of child life extended from the moment of conception until the infant was born, and it was important to remember that during this period the child was absolutely dependent upon the blood of the mother Both oxygen and food for the child's growth were obtained from the mother's blood Alcohol taken by the mother passed into the child's circulation until it was equally concentrated What added to the seriousness of the matter was that the child would be subject to the influence of the alcohol for a comparatively long time owing to the tardiness of its disappearance from the tissues of the unborn The child of a chronic alcoholic mother was itself a chronic alcoholic absorbing alcohol from its mother's blood and, after birth, from her milk And that despite the fact that the law of the land prohibited the giving of alcohol to an infant under 5 years Alcohol was definitely not a factor in stimulating milk secretion Professor Fleming urged the League to use its influence to ensure that these facts were widely known so that expectant and nursing mothers might be led voluntarily to abstain from alcohol

Pathological Effects of Alcohol

Sir HUMPHRY ROLLESTON said that in certain circumstances in those convalescent from disease and in debilitated old age alcohol might serve a useful purpose in exciting an appetite for food and facilitating its digestion Also in the last stage of man's strange eventful history when the sands were running out alcohol might be merciful and comforting That did not however justify the wide spread cocktail or sherry parties for the young A famous liqueur had been found experimentally to be more poisonous than a mixture composed of methyl or wood alcohol 80 per cent and ethyl alcohol 20 per cent There was risk that the cocktail fashion might be responsible for biliousness due to temporary depression of the protective function of the liver and later lead to confirmed addiction with all its evil and ultimately more serious permanent effects Alcohol tended to weaken or paralyse the brain cells from above downwards and when circulating in the blood and so reaching the brain put the censor '—to use Freud's term—out of action Quantities of alcohol far too small to induce symptoms of intoxication led to a measurable loss of accuracy in the neuro-muscular control and thus played an important part not only in road accidents but in accidents in industry

A distinction should obviously be made between pure neat alcohol and beverages containing it The effect of constituents other than alcohol in alcoholic drinks might be beneficial or the reverse Sugar contained in malt liquors and in many wines was a valuable food and indeed tended to counteract the degenerative effects of the alcohol which it so closely resembled chemically Excess of sugar induced obesity in beer drinkers Overweight and obesity favoured the onset of diabetes mellitus Quite apart from the other constituents of alcoholic drinks, alcohol was a form of food but a jealous food for if taken habitually in excess it impaired appetite and the digestion of food The direct effect of contact of concentrated alcoholic drinks, taken habitually when fasting, led to chronic inflammation of the stomach with resulting alcoholic dyspepsia seriously impairing nutrition Clinical experience showed that addiction to alcohol impaired the power of the body to resist infection From analysis of 3,422 cases of pneumonia Weeks found that the mortality was 50 per cent among excessive drinkers, 34 per cent among moderate drinkers and only 23 per cent among occasional drinkers and total abstainers

The interrelations of chronic alcoholic excess and mental disorders were close and might be complex Chronic addiction perhaps dating from youth might not send in its bill until middle life when general efficiency should otherwise be high Then gradually but surely mental deterioration more obvious to onlookers than to the patient came prematurely The mental change might take several forms Alcoholism might play a contributory not the sole part in some forms of mental disorder or it might be merely a symptom or index of mental instability Again cirrhosis of the liver was by no means confined to chronic alcoholics it might occur in total abstainers who took other irritating substances such as highly spiced curries and ginger Chronic alcoholic excess might cause cirrhosis indirectly and so act on the stomach and intestines that poisonous bodies would be formed and carried to the liver In conclusion Sir Humphry Rolleston said that what was needed in regard to alcohol was education not prohibition Events in America had shown that prohibition tended to induce a most undesirable reaction

Food Value of Alcohol

Sir FREDERICK GOWLAND HOPKINS asked first, and in particular did alcohol itself contribute to normal nutrition? Alcohol was relatively so expensive that to put it in the same category as butter from the point of view of practical dietetics would be the height of absurdity Nevertheless like butter it could be burnt in the body and each yielded there the same amount of heat as it yielded wherever burnt It was possible to purchase one ounce of good butter for a penny One ounce of alcohol in the form of good whisky cost eighteen pence, *in the form of sherry say fifteen pence and in the form* of champagne, at least five shillings True one could obtain an ounce of cheap beer for from fivepence to eightpence but it was necessary to consume a whole pint of the liquid to get an ounce It would therefore be economically ridiculous to suggest that fat could in the food budget of a family be replaced by a quantity of alcohol equivalent in fuel value What however removed a discussion on the food value of alcohol from the academic or purely scientific field was the existence of propaganda which for trade or other purposes explicitly or implicitly proclaimed that alcohol had nutritional merits He found the question Is alcohol *in any sense*

BRITISH MEDICAL JOURNAL
LONDON
SATURDAY DECEMBER 11 1937

SURGICAL TREATMENT OF ANGINA PECTORIS

The surgical procedures recommended for the relief of angina pectoris are so diverse that it may be helpful to group the various operations according to their modes of action Angina is generally regarded as evidence of an inadequate blood supply to the heart muscle, due as a rule to coronary occlusion, and certainly the angina of effort is strictly comparable to the pain of intermittent claudication Some of the operations for angina are designed to improve the nourishment of the heart, whereas others are intended merely to abolish the pain the former, in fact, are attempts to treat the cause, and the latter deal only with its effects An adequate blood supply to the heart may be restored in two ways either by what at first appears to be the impossible ideal of providing the myocardium with new blood vessels, or by so diminishing the work of the heart that the nourishment brought to it by the vessels which are still patent may be sufficient for its smaller needs In the first group are Claude Beck's method of removing the bony chest wall and laying the pectoral muscle as a graft upon the heart, and Laurence O'Shaughnessy's ingenious operation,[1] in which, with the left side of the chest open, the great omentum is withdrawn from the abdomen through an opening in the diaphragm, and is then stitched to the anterior surface of the ventricles so that it will not only vascularize the muscle but will provide anastomotic channels between the right and left coronary arteries Although the latter operation might appear to be unduly hazardous, it has now been successfully carried out often enough for us to say that elderly patients with coronary disease can stand it when proper precautions are taken to avoid shock, and that with it shock is less likely and success more likely than with Beck's operation The results published by O'Shaughnessy are most encouraging for though one out of his first six patients died (from duodenal haemorrhage) a week after the operation, the other five have obtained relief from their symptoms and have regained some of their lost activity

In order to lessen the work of the heart the operation of total thyroidectomy was introduced, on the assumption that if the body metabolism could be reduced the demands upon the heart would also be lessened The results fell so far short of expectation in cases of heart failure, and the consequent myxoedema was such a handicap, that the operation might have been abandoned had it not been observed that the great majority of patients with angina were relieved thereby And it is important to note that when total thyroidectomy is performed for angina post-operative myxoedema is not a serious complication, the requisite amount of thyroid extract may be given without causing a recurrence of pain Though it is now recognized that the benefit derived from the operation cannot be accounted for merely by its effect upon metabolism, the therapeutic value of total thyroidectomy in properly selected cases of angina is undoubted French surgeons, on the other hand, have concentrated upon the abolition of cardiac pain by denervating the heart, and their attitude has been clearly stated in an excellent review of the whole subject by Marcel Bérard [2]

English and American surgeons have regarded sympathectomy for angina merely as a method of interrupting the visceral afferent fibres which accompany the cardiac branches of the inferior cervical and upper four or five thoracic sympathetic ganglia These visceral afferents have their cell stations in the posterior root ganglia of the spinal cord, and the benefit to the patient which follows section of them is believed to be due only to the blocking of pain impulses, though the cause of the pain is still active Leriche and his followers, however, look upon the sympathetic ganglia as reflex centres where afferent impulses from the heart itself, as well as from other parts of the body, may excite pressor reflexes, which cause both acceleration of the heart beat and spasm of the coronary arteries The removal of the ganglia, and of the stellate ganglion in particular, is therefore considered by these workers as a matter of fundamental importance Bérard gives their reasons for believing that ganglionectomy, because it can prevent spasm of the coronary arteries, should be placed in the group of operations aimed at treating the cause, since in their opinion it has the effect of improving the blood supply to the heart muscle That these ganglia may be removed without undue peril to the heart's action is an important fact which has been learnt by experience, and there does not seem to be any call for the intricate neurectomy practised by Danielopolu to avoid tampering with the stellate ganglion But the method of alcohol injection employed with so much success by James White of Boston must be looked upon as an alternative to ganglionectomy, since to those who are unable to accept the dominant role of the sympathetic ganglia it offers a means of blocking the

[2] *Les Méthodes Chirurgicales du Traitement de l'Angine de Poitrine* By M Bérard Paris Masson et Cie 1937

a food? difficult to answer in clear-cut terms No subject of scientific inquiry had led to such contradictory results or such diversity of opinion Even the scientifically trained could not always wholly avoid the subconscious effects of bias, and that might influence, to some degree at least, the conduct of experiments Especially might it affect the interpretation of results

Nevertheless, the chief cause of discrepancies in the results were difficulties inherent in the experimental problem itself The fact that alcohol was oxidized by the tissues was by itself no proof that alcohol thereby fulfilled the proper functions of a food Oxidation was one of the means by which the body got rid of matter foreign to its economy Without evidence to the contrary it might be quite legitimately supposed that alcohol came into such a category An important and significant aspect of the facts was revealed by the question, Is energy which the combustion of alcohol liberates in the body available for the support of muscular activity? Modern studies of chemical events which occurred when a muscle contracted had given good reason for doubting in advance that alcohol could play a significant part Those events involved the combustion of the sugar eaten or derived from the starch consumed The combustion of sugar took place in a succession of steps or stages so that energy was made available within the muscle in the right place and at the right time

Alcohol, Energy, and Work

The chemical machinery involved was so subtle and so highly specialized that it was very difficult to see how any fuel could be adequately employed in it save the sugar that was the natural fuel The other natural foods—certainly the proteins—could be partly converted into sugar in the body, and that rapidly They could thus serve the working muscles indirectly Alcohol, on the other hand, was certainly not converted into sugar Sir Gowland Hopkins went on to give details of the experiments which supported these *a priori* considerations The conclusion to be drawn from those careful studies was that work did not increase the rate with which the alcohol disappeared from the blood and tissues It could not, therefore, have provided energy for the muscular work done Again, it had been shown that alcohol combustion seemed to be a device more for protection than one for utilization If it were proved that the consumption of alcohol lent no support to an individual s daily activities, then research workers would be in possession of a fact of practical significance as well as of scientific interest

Could alcohol supply the basal internal needs of the body? On this point so marked were the contradictions that Sir Gowland Hopkins suspected either that the right technique had not yet been acquired for studying the question or that there were unsuspected factors in the problem that had led some experimentalists astray It was somewhat difficult, since alcohol could not subserve muscular activity, to see how it could effectively cover the needs of basal metabolism Nevertheless, a piece of recent research seemed to show that alcohol, when added to a dietary not by itself adequate to support a normal rate of growth in young rats, was able to accelerate that growth Alcohol could, of course, only possibly support growth indirectly by sparing the normal growth materials from combustion by being burnt in their stead Though of scientific interest the outcome of that research had no direct bearing on practice No one, certainly would employ alcohol for encouraging growth in children or adolescents

Some Practical Bearings

Discussing the problem in its more practical aspects Sir Gowland said that the conference met at a time when the nation, and now its Government—largely due to the efforts of an enthusiastic minority—had been made aware that large sections of the population were ill nourished and less physically fit than they should be There was a widespread desire to remedy that state of affairs All knew that, whatever aid to physical fitness other measures might provide for the poor, and indeed for a large section of the wage earning class, better nutrition was the most to be desired Very many of the family budgets of these classes had been collected and studied It would be insincere not to admit the fact that in a great number of cases the expenditure of the chief wage earner upon beer reduced to a significant extent the ability of the house wife to buy adequate food for the rest of the family That expenditure was seldom given among the figures of a family budget Naturally, among the working classes as among others, the circumstances of life called for some form of self-chosen luxury It was nevertheless unfair and even cruel, that propaganda, subtle, suggestive, and intensive, should endeavour to persuade the worker that his beer made him more robust and increased the power of his muscles, thus tempting him to increased consumption and helping to salve his conscience when he knew that his expenditure on it was beyond his means

HEALTH RESORTS CONFERENCE AT BATH

THE SPA AS A NATIONAL ASSET

The city of Bath extended its traditional hospitality during the week-end to a number of members of the medical profession meeting under the auspices of the British Health Resorts Association It was one of the most successful of the events which that body has arranged Two useful and well sustained discussions were held in the Technical College—the old hospital—one of them on the role of the spa in the maintenance of physical fitness, and the other on hydrological methods in the treatment of injuries and diseases of the joints The guests were taken round the bathing establishment, where demonstrations (with patients) were given of the various hydrological methods, including the deep bath, the hot pool, and the thermal vapour treatment The mayor and corporation entertained the visitors to dinner at the Guildhall, an orchestral concert was arranged in the famous Pump Room, a visit was paid to the Roman baths and, finally, the party were taken on a short motor tour of the environs of what has been described as the most nobly placed and best-built city in all England

Physical Fitness and the Spas

At the first conference which was presided over by Lord MESTON the subject of the health resort in relation to the campaign for raising the standard of national fitness was opened by Lord HORDER Most of the acute and devastating diseases, with the exception of cancer, said Lord Horder, were now under fairly good control there remained the less lethal though economically and socially distressing, states of ill-health, of which rheumatic diseases, functional nerve diseases, and metabolic disorders were examples In dealing with such deviations from good health the spa could be of great assistance But health was not mere absence of disease It had a positive quality which was capable of almost indefinite extension, and here again the spa—later Lord Horder made it plain that he was referring to health resorts more generally—could help by the intensive cultivation of amenities, such as clean air, close contact with earth and sun, beautiful sights and sounds, with leisure to enjoy them If the resorts were to raise the level of fitness for those free from disease it would mean co operation between municipality, hotel proprietors, and doctors Lord Horder made amends for some criticisms of British hotels uttered on a similar occasion at Bournemouth earlier in the year He was prepared to say that there had been a great improvement both in the matter of quiet and of cuisine, thanks not a little to the British Health Resorts Association and its dynamic secretary (Dr Alfred Cox)

afferent fibres to the upper five thoracic nerves on both sides of the body without exposing the patient to the inevitable risk of a major operation Finally it may be noted that the denervation operations are not found in practice to be followed by the increased liability to sudden heart failure which was formerly believed to jeopardize the life of a patient deprived of the warning afforded by his anginal attacks

ASSESSMENTS OF NUTRITION

At a recent meeting of the Royal Statistical Society Mr R Huws Jones read a paper entitled "Physical Indices and Clinical Assessments of the Nutrition of School Children" which led to a discussion of medical interest Mr Jones had set himself the task of trying out various indices based upon simple measurements, which various writers have suggested as criteria of nutritional states in children, in the hope of finding one which would save public time and money He wished to find an index which would pick out all the children a physician would certainly regard as undernourished and as few other children as possible the result would be that medical officers' time in routine examination might be saved and they would have more leisure to examine those children in special need of expert attention In the inquiry he was naturally led to test the medical officers themselves—that is to compare the classifications made by different medical men examining the same children and the classifications of the same medical officer examining the same children after an interval of a week The statistical results he obtained were as two speakers in the discussion remarked very similar to those of Sir Philip Hartog and his colleagues in their examination of examiners Sir Philip Hartog's commission found that a set of experienced examiners often disagreed one with another on the merits of the same scripts, and that the same examiner reading the same scripts after an interval of time, differed from himself in an appreciable number of cases Mr Jones reached the same conclusion For instance, one school medical officer examined 193 children, and at his first examination placed 36 in class A (the best class) 146 in class B and 11 in class C A week later his grouping was 48 in A, 142 in B and 3 in C

The paper led to a lively discussion, not the less lively because few of the speakers seemed to have a very clear idea as to what they were in fact discussing To take two reductions to absurdity —certainly not reached by any speakers but approached—it is no more possible by the combination of measurements to reach an 'index' which will replace the judgement of a trained observer than it is possible by drilling young men in the rules of dramatic composition to increase sensibly the supply of plays as good as *Hamlet* It is equally hard to believe that all or even a very large proportion of medical men have the kind of insight into clinical states which enables a gifted few to divine truth without the aid of physical measurement Indeed, to use data of this kind to disparage either measurement, on the one hand, or clinical judgement on the other implies a confusion of thought One has the wearisome conflict between science (of a kind) and art (of a kind) The notion of indices compounded of bodily dimensions—weight, height, chest circumference, etc — is based upon the truism that without adequate food normal growth is impossible The criteria of what values of such indices shall be regarded as good or bad depend upon observation of their average values in groups believed, for other reasons to be well or ill nourished Very often the basis has been a comparison of children of different social classes sometimes a comparison with clinical judgements The point to mark is that the operation is a statistical operation its result valid for the comparison of groups and for no other purpose The judgement of a physician on the state of a child is an individual act of discrimination it depends upon a synthesis of past experience and immediate impressions and is coloured by the personality of the observer Because an observer rates the same individuals differently even after so short an interval of time as a week, it does not follow that he is inconsistent with himself Even in adults still more in children, psychological states or quite trivial illnesses may rapidly alter appearance That alteration may indeed be evanescent but the observer must deal with what he finds One cannot appraise the value of a medical officer's skill by rough-and-ready methods such as these One needs to correlate his judgements of the individuals forming the same group observed by him over a long period with those of a master of the clinical art. That is of course, a difficult undertaking

Perhaps the wisest remark made in the discussion was that instead of inciting medical officers—by official circular or otherwise—to assess states of nutrition it would be better to leave them to mark down children who in their opinion, needed further *medical* supervision It is possible to overdo the compilation of official statistical tables and quite certain that in the present state of knowledge, the connotation of the term "malnutrition" is not precise enough for it to be possible to adopt routine methods which would permit of numerical results being reached which are at once strictly comparable and really informative for all parts of the country

Dr G R P ALDRED BROWN of Bath reviewed the use of the spas in correcting the breakdowns of middle age and in supplying a measure of rejuvenation to the old But he also mentioned the value of the spa in adolescence and early adult life especially in preventing the tendency to a rheumatic soil If these people could be brought to the spas for regular courses of treatment so that their bodies were educated to function normally they might escape those crippling scourges which were the result of a cold damp climate on a receptive constitution It would be costly but enormous funds were lying at the disposal of certain approved societies At present additional benefit No 16, introduced by the Insurance Act 1928 which consists of payments to approved institutions in respect of treatment of members required for the prevention or cure of disease, allowed insured persons to attend rheumatic clinics only at three places—the Red Cross Clinic in London, and at Sheffield and Glasgow It should be extended to include spas

A very ambitious programme for the health resorts was put forward by Dr JAMES FENTON chairman of the *Central Council for Health Education* He satirized the idea of a spa as a place where old ladies or retired colonels were drawn in bath-chairs to their daily ritual The spa was a national asset in the maintenance of physical fitness, but he feared it had been in danger of becoming a frozen credit The new powers under the Physical Training and Recreation Act, 1937, would enable a spa to add playing fields, community centres, clubs gymnasiums

"I should like to see the British spas recognized as universities of physical training. I visualize the time when to have learnt say fencing at Bath will carry the same weight in its particular sphere as to have studied art at Florence, when we shall no longer talk of Swedish drill but of the latest Leamington methods and when the natural rendezvous for tournaments olympiads and sports gatherings of all kinds will be the spa

Government Indifference

Dr ALFRED COX remarked on the lack of interest shown by the Government in the spas of the country It was very different elsewhere In France the spas were approved and helped by the Government, which owned one of them In Germany half the spas were Government-owned as were six, each with a climatological station in Czechoslovakia In Russia with Government backing the number of spas had trebled since the revolution He mentioned also the interest taken by Continental universities in the teaching of hydrology Here so far as he could see the Government had done nothing save for half a page in the annual report of the Chief Medical Officer of the Ministry a couple of years ago drawing attention to the value of the spas in rheumatic diseases Mr W MCADAM ECCLES suggested that the medical profession in Bath should set themselves to find out whether the incidence of rheumatism was less in Bath than in other cities So far as he was aware no paper had been written on the incidence of rheumatic fever in spa areas

The undesirability of advertising individual health resorts was brought forward by Dr C W BUCKLEY of Buxton There was a disposition for a given resort to claim every virtue and the resort which commanded the longest purse or the cleverest pen scored over all the rest. He deprecated spas descending to the level of proprietary medicines in their advertising Publicity funds should be pooled and placed under the control of some association which would use them as a means of educating Parliament the medical profession and the public in the objects to be attained

A cold douche for the expectations of large sums from approved societies in support of spa treatment was given by Mr HENRY LESSER late chairman of the Consultative Council of the Ministry of Health He said that the total sum which was allocated to the various treatment additional benefits under the fourth valuation schemes in force during 1937 was £3 345 576 But of this sum dental benefit absorbed £2,174 920, ophthalmic benefit £542 663 convalescent home treatment, £204 975 and medical and surgical appliances £198 673 Additional benefit No 16, under which payment for spa treatment might be made came seventh on the list with £34 615 as the annual amount allocated When the eighteen million insured persons were considered there was really no money available for benefits of this kind It cost at least £3 a week to send a worker from London to a spa and it was of no use sending him for less than three weeks The total amount would be equal to the capitation fee for the one individual for twenty years!

Dr W EDGCUMBE of Harrogate protested against Dr Fenton's proposals for the brightening of spas The serious spa patient did not want these distractions They diverted him from his cure At least if the spas were to be used as centres of physical culture for the improvement of the national health, and their amenities—a word capable of wide interpretation—were to be increased some enclosure should be made for the benefit of the ordinary spa patients so that they could get the necessary quietude He also pointed out that while the spa hospitals had a waiting list the general spa clientele was diminishing The old idea of large numbers of the wealthier classes paying an annual visit to a spa was slowly dying out Dr COLLIS HALLOWES of Torquay spoke on the desirability of having the publicity departments at all spas controlled by the medical profession, at least there should be medical representation on the publicity committee Sir STANLEY WOODWARK pointed out some of the limitations under which the approved societies worked in the matter of convalescent or spa treatment Lord HORDER in replying to the discussion, said that his remarks had been intended to apply to health resorts in general, not to spas in particular He agreed that a great disservice would be done to medicine if the spas were in any way disadvantaged in what they offered for the treatment of patients seriously ill

Hydrological Methods in Joint Affections

The second discussion, presided over by Lieut Colonel W B BYAM chairman of the Medical Advisory Committee of the Association was on hydrological methods in diseases of joints The visitors came to it directly from a very complete tour of the bathing establishment

Dr F G THOMSON of Bath opened with a comprehensive survey of the subject It was his considered opinion that no case of rheumatoid arthritis was suitable for a course of hydrological treatment so long as the slightest sign of activity still persisted The mildest form of balneological procedure was likely to set up an excessive reaction which did more harm than good When the fire had burnt itself out and left only the charred remains in the form of distorted joints and twisted limbs mild treatment by immersion baths submerged douches and possibly passive movements might do a great deal to relieve the residual pain and increase the range of movement In the case of osteo arthritis the indications were the very opposite to those in rheumatoid Sedative treatment such as warm immersion baths with hot undercurrent douches or local hot packs was useful He warned against extensive and particularly forcible passive movements to an osteo arthritic hip or other joint For gout there were three indications for treatment

1 To put the gastro-intestinal system in a healthy state by suitable diet low in protein content and irrigation with mild saline or other suitable waters

2 To ensure free elimination by diuretic or laxative waters and by some form of bath treatment to induce free perspiration

3 To stimulate the metabolism of the tissues generally and of the usually deficient liver in particular This last treatment not to be undertaken until free elimination by bowel kidney and skin was assured

DYSENTERY AND ACUTE DIARRHOEAL DISEASES IN CHILDREN

During the last few months there has been a notable increase in the incidence of dysentery and diarrhoeal diseases, chiefly in children [1] Small outbreaks have been reported from various parts of England and Wales but the largest increase has been in London especially in the eastern and south eastern districts The emergence in epidemic form of the type of dysentery associated with the Sonne organism is partly responsible for the increase in gastro intestinal disorders, but by no means completes the picture from either the clinical or the bacteriological standpoint Hitherto in this country Sonne dysentery has for the most part remained localized or sporadic in character in contrast with its endemic-epidemic prevalence in the United States and the Scandinavian countries Generally speaking the disease runs a benign course, characterized by the passage of loose stools mucus, and possibly some streaks of blood, going on to resolution in seven to ten days The organism is readily isolated from the faecal matter in the first three to four days of the disease, but thereafter isolation may be difficult although a few patients become carriers for some weeks or months The very mildness of the disease is mainly responsible for its spread, as many cases are undetected or become temporary carriers without undergoing recognizable attack Sometimes the organism is more readily recovered from a rectal swab than from the stools Should the cultural findings prove negative the patient's blood may be tested for the presence of specific agglutinins, which are usually present seven to twenty-one days after the onset a titre of 1 in 50 is taken to indicate recent infection, but lower titres should be viewed with reserve, as the organism may agglutinate spontaneously On the other hand, a negative agglutination test does not exclude the disease Symptomatic and dietetic measures usually suffice in treatment Dysentery due to Flexner strains is commonly more severe but recovery is the rule like the still more deadly Shiga infection, for which an antitoxic serum is available in treatment, it is but infrequently met with in this country The recent prevalence of Sonne dysentery has focused attention on the gastro-intestinal disorders in children in which diarrhoea is the predominant feature After excluding cases of dietetic and parenteral origin there remains a large group of cases difficult to classify satisfactorily In these the causative agent is generally believed to be transmissible from patient to patient as a rule by means of contaminated milk, although formal proof of this is not always forthcoming The unsatisfactory state of the bacteriology of these disorders adds to the confusion In this country Morgan's bacillus, in France *B proteus* and in the United States the *Staphylococcus aureus* have at various times been incriminated Probably the organisms of the salmonella group or their toxins are responsible for many epidemics in which the course of the disease is short and large numbers are affected at the same time The uniformly equivocal or negative bacteriological findings have led some workers to give attention to the biochemical changes in the human subject. In severe attacks are found rapid dehydration excessive loss of base (especially sodium) in the stools, and starvation resulting in the condition known as alimentary toxicosis Renal damage often leading to complete suppression of urine further intensifies the tendency to acidosis Correction of the metabolic processes by introducing into the circulation physiological saline and glucose produces a rapid improvement which only too often is not maintained relapses are common, and the patient passes into a marasmic state from which recovery is uncertain and tedious Septic complications such as otitis media and broncho pneumonia are often responsible for prolonging this stage and may determine a fatal issue Concurrently with these metabolic disorders certain alterations take place in the intestinal flora recent work on this in Glasgow was commented on in these columns a short time ago [2]

OSTEOMALACIA OF THE SPINAL COLUMN

The nature and causation of osteomalacia and its relation to rickets have been extensively studied of recent years The famine conditions prevalent in Austria after the war furnished evidence of the effect of insufficient and unsuitable food in giving rise to deficiency diseases in the bones One of the consequences has been to remove osteomalacia from the category of diseases of endocrine origin and to include it among the disorders of nutrition The work of Maxwell in China has thrown much light on the subject, and the modern view has been summarized in the statement that osteomalacia is adult rickets It is a point of some importance that while osteomalacia in relation to puerperal conditions affects chiefly the pelvis the non-puerperal variety frequently affects the spine alone and is often associated with senile kyphosis the characteristic appearances are shown in specimens illustrated by Beadle in his monograph on the inter vertebral disks as senile kyphosis with osteoporosis Meulengracht and Rothe Meyer[3] have recently given an account of four cases of osteomalacia of the spine (three women and one man between the ages of 48 and 77) with a review of the literature Marked dietetic deficiencies had been present in each case, and though these were not identical in kind lack of milk appeared to have been an important factor In view of some of the fads in diet that are now popular it is of interest to note that three of the patients had been dieted or had dieted themselves very strictly on account of dyspepsia Weissenbach and Lievre at a meeting of the Societe Medicale des Hôpitaux de Paris in 1935[4] reported two cases of what they called 'deficiency bone disease" in preference to osteomalacia following the treatment of hypertension by marked restriction of diet and by purgation The chief deficiencies as in rickets, were

Taking it all round, the most useful bath for chronic rheumatic cases generally was the oldest, simplest, and least spectacular—namely, the deep or reclining immersion bath with undercurrent douching or manipulative exercises, as the case might seem to require

SIR HENRY GAUVAIN gave a brief account, illustrated by lantern slides, of the treatment at Alton and Hayling Island At Hayling Island sea-bathing therapeutically was used, first for its effect on the general metabolism of the body, and secondly for its action on local lesions He discussed the technique of sea-bathing and the pool treatment at Alton Cases of infantile paralysis, rheumatoid arthritis, recovering paraplegia following spinal caries, and many cases of weak musculature or stiffened joints had derived much benefit from the pool treatment, with a depth of water of about 2½ feet, and a temperature of between 90° and 100° F The pool was not used for surgical tuberculosis, other than paraplegia, nor for cases of osteomyelitis or septic arthritis

The use of hydrological methods away from spas or coasts was discussed by Dr W S C COPEMAN physician, British Red Cross Clinic for Rheumatism in London He set out the methods most widely used in this country

1 The deep pool at 100 F

2. Reclining baths, both of plain and mineral waters

3 Manipulation douches Aix or Vichy

4 Packs of local peat (at most spas) or dried imported mud (at town clinics)

5 Vapour baths (there was a tendency at present to prefer hot air to vapour baths in the treatment of arthritic patients)

6 Foam baths

He also mentioned the contraindications to hydrotherapy He shared the view that no case of true rheumatoid arthritis in any active phase should ever be treated by hydrotherapy

The Treatment of Rheumatoid Arthritis

Dr C W BUCKLEY declared himself an unrepentant believer in the hydrological treatment of rheumatoid arthritis, except in the very acute cases A case of rheumatoid arthritis in the severe stage had little or no capacity for reaction That capacity had to be educated, and it could be better educated by hydrological methods, applied cautiously, than by any other Hydrological methods were not necessarily institutional, there was no reason why the patient should not have properly supervised baths at home Dr EDGCUMBE insisted on a distinction between plain water as used in a town and mineral water as used at a spa He claimed a definite advantage for the use of the latter, speaking now of its external use The physiology of the action of plain water baths as compared with mineral water baths was very involved, and not enough experimental work had been done, but he thought that investigation did show with an immersion bath of mineral water a definitely increased reaction and very much less risk of any unfavourable reaction On the other hand, Dr GERALD SLOT asked whether there was any obvious reason why for treatment in London the water should not be artificially mineralized If that were done he wondered whether there would be any material difference between the waters as administered at Bath and other spas and as administered in London There had been some talk of a three-weeks course of treatment, but that was not nearly long enough for rheumatoid arthritis What was wanted was some easy form of home treatment Mild hydrological treatment for rheumatoid arthritis was also advocated by Dr FRANK CLAYTON of Leamington, but he pointed out that until some definite pathology of rheumatoid arthritis was discovered treatment must be unsure

The use of hydrological methods in rheumatoid arthritis had another supporter in Dr A R NELIGAN of Droitwich ...int, he pointed out, was only the servant of the muscle, and water was perhaps the best medium for developing muscles, a procedure best carried out in the therapeutic pool He was surprised that there were in this country not more therapeutic pools fitted with certain forms of apparatus Although America was behind Britain in hydrology it was in front in the provision of therapeutic pools The concentrated brine which he had to use was of great assistance in re educating muscles and joints

Dr DE BEC TURTLE stressed the value of home treatment Even the humblest dwelling now had a bathroom, in which a great deal could be done under proper instruction Dr J B BURT of Bath mentioned points which in his view illustrated the difference between mineral water and tap water Finally, the complaint was made by Miss FORRESTER-BROWN of Bath that so much had been said about joint diseases but nothing at all about joint injuries, on which, she thought, physicians might throw some light

Mayoral Banquet

A civic banquet was given in honour of the conference, the Deputy Mayor (Mr W F LONG) presiding in the absence of the Mayor through indisposition

In proposing the toast of the British Health Resorts Association, Dr F G THOMSON said that after some years the Association was one which now commanded great respect and exerted much influence, but at the same time it had great responsibilities It had been formed at a time when this country was suffering from a severe financial setback, and an appeal was made to the public for 'self-sacrifice'—namely, that it should visit the British health resorts instead of those resorts abroad thought to be superior to the ones in this country, which, however, need fear no comparison with any others They had, Dr Thomson thought, suffered from the ineradicable tendency in this country to run down anything British, especially when it was a question of amenities He was inclined to think that undue prominence had been given to this aspect, and if they could convince the people of Great Britain that spa treatment was a serious business and not a stunt they would get much more support As medical students, most doctors in general practice had had no instruction in spa treatment, and had therefore come to look upon it as something unorthodox and so to be avoided Such men would not send their patients for spa treatment unless they could be convinced that definite benefit would result Dr Thomson then made a plea for systematic scientific investigations into the physiological properties and therapeutic actions of the waters employed in spa treatment The British Health Resorts Association, as an unbiased body, might publish the results of such an investigation, which would then have an authority behind it not to be obtained if any individual spa published such results Dr Thomson coupled with the toast the name of the president, Lord Meston

In response Lord MESTON expressed the gratitude of the British Health Resorts Association for the splendid hospitality shown by the City of Bath He assured Dr Thomson that what he had said would be very carefully studied by the British Health Resorts Association the early history of which Lord Meston lightly reviewed It was he concluded, a patriotic association, served by men who gave their time in no self seeking spirit

In proposing the toast of "The City of Bath,' Lord HORDER said that Bath was renowned for its architecture, for its associations with monarchy, and for the part it had played in the world of fashion The famous springs of Bath were hot by nature and not by artifice Bath was royal, it was founded by a Saxon king, and kings and queens had frequented Bath as they had frequented no other place In A D 55 the Romans decided that Bath had a contribution to make to hygiene All our health resorts had a contribution to make now, a contribution to the solution of the problem of national fitness

in those foodstuffs supplying adequate amounts of calcium and phosphorus together with vitamin D and the restoration of these elements quickly relieved the symptoms An interesting point is that osteomalacia does not appear to occur in the Indian famines probably because of the effect of sunlight in promoting the formation of vitamin D in the subcutaneous tissues of the scantily clothed natives The early symptoms of the disease are not characteristic although as Maxwell[1] observes an early symptom of deficiency of calcium and vitamin D is pain in the back In osteomalacia this is followed by radiating pains in the inter costal nerves and the branches of the lumbar and sacral plexuses with tenderness of the bones and increasing deformity *X*-ray examination reveals loss of lime salts (halisteresis) with compression and gradual destruction of the bodies of the vertebrae giving rise to kyphosis The vertebral bodies tend to assume a biconcave appearance like those of fish this is due to expansion of the disks against the yielding spongiosa and is characteristic though various other irregularities of shape may be present. Diagnosis in the early stages before deformity has begun is of importance but may present much difficulty there is little doubt that many cases have been regarded as spondylitis especially of the so-called Bechterew type for as the kyphosis develops the anterior edges of the vertebral bodies in the dorsal region are brought in contact and tend to become ankylosed It is probable that slight degrees of osteomalacia of the spine may be more common than is generally supposed as the result not only of actual deficiency in the diet but of lack of balance excess of fats it is known may interfere with the absorption of calcium or there may be defective assimilation from other causes Rheumatic pains in the intercostal or lumbar regions which do not yield to physical treatment should be submitted to early x-ray examination and the possibility of defective nutrition which is not necessarily manifested by marked loss of weight should be investigated The observations of Meulengracht and Meyer are of great value and deserve careful study

SURGERY IN GENERAL PRACTICE

We print this week at page 1179 the first of a series of signed articles under the general heading of "Surgical Procedures in General Practice" Like the previous articles on medical treatment and on anaesthesia those on surgery which are to appear weekly in these columns during the next few months aim at giving the man in general practice detailed up to date and accurate information which he can turn to practical account in his daily work Although much of what will be written may be familiar to many readers we believe that they will welcome a restatement of first principles in a systematic manner and the refresher course that such a series provides It is hoped too that the series will serve as a practical guide to the newly qualified practitioner about to take up his first appointment as a house-surgeon The first group of articles will deal with such conditions and methods as apply to the body generally and after this the various anatomical regions of the body will be considered in turn Any attempt to include all those surgical measures which are in fact carried out by men in general practice would probably have meant the writing of a complete textbook on surgery To include only those conditions which might fittingly come under the attractive but misleading heading of minor surgery would have made these articles of little practical use if the meaning of the term "minor" had been closely defined and rigidly adhered to In planning the series we have therefore tried to strike a mean which corresponds to the average experience of the family doctor and by using the term "surgical procedures" in the main title will be able with a clear conscience to refer to such things as belts and trusses the choice of hearing aids and the after-treatment of certain major operations

LATENT SCURVY IN INFANTS

Various workers have investigated the problem of latent scurvy in young infants by the indirect method of the capillary resistance test, and recently P W Braestrup[1] has applied this test to newly born children and to those during the first year of life He prefers the constricting arm-band to the suction cap method which he considers unsuitable and tests both arms at the same time since the numbers of petechiae produced with a pressure of 70 mm of mercury for four minutes varied considerably between the right and the left arms The petechiae were counted in a circle 4 cm in diameter stamped on the skin and divided into nine fields to facilitate counting - The babies tested were born in the maternity ward of the Rigshospitalet, Copenhagen or were attending a clinic for healthy breast-fed children Children with signs or symptoms of disease were excluded The results are expressed as the number of petechiae in both arms together any figure up to ten is taken as the normal value for adults and any figure above this as evidence of lowered resistance An interesting feature of the results obtained by this method is the absolute resistance of the newly born for in 125 babies (including thirty five premature infants) tested during the first twenty four hours of life there was an average of 0 73 petechia These results go to disprove the hypothesis that the tendency to haemorrhage in the newborn infant is due to capillary fragility caused by latent scurvy (Incidentally the investigations were carried out at a time of year when the seasonal variations in vitamin C intake are at the lowest level) Among the older infants it was found that in about half of those who were healthy and breast fed the capillary resistance was lowered between the ages of 1 and 5 months and in about 10 per cent of the infants on a mixed diet between the ages of 6 and 12 months When ascorbic acid was given to certain infants the capillary resistance was restored to normal in three out of eight and tomato

ROYAL COLLEGE OF SURGEONS

OPENING OF BERNHARD BARON LABORATORIES

The Bernhard Baron Research Laboratories at the Royal College of Surgeons of England in Lincoln's Inn Fields were opened by the Earl of Athlone on December 8. The erection of the laboratories has been made possible by the generous gift to the College of £30,000 by the Bernhard Baron Trustees as a memorial to the philanthropist who made noteworthy gifts during his lifetime to hospital work, especially to the London and the Middlesex and to the advancement of medical and surgical knowledge.

To accommodate the laboratories considerable remodelling of the upper floors of the main College building has been necessary, new wings have been erected at the east and west ends, and a new floor added. Yet as Lord Athlone in his opening speech remarked this has been done without detracting from the appearance of Sir Charles Barry's great building; indeed the additions have improved the architectural design giving it still more imposing and beautiful proportions.

Royal College of Surgeons of England showing the Bernhard Baron Laboratories added.

The ceremony took place in the lecture theatre where Mr EDWARD BARON on behalf of the trustees asked the President (Sir Cuthbert Wallace, Bt.) to accept the laboratories for the use of the College. He said that the trustees were of course well aware of the great traditions of the College and its unique museum, but on visiting Lincoln's Inn Fields they were impressed also with the very difficult conditions and inadequate accommodation in which such important work was done. He added that they now greatly appreciated the splendid use which had been made of the grant they had felt it their duty to offer. In asking acceptance of the laboratories they did so with the fullest confidence that a steady stream of helpful discovery would result from the labours of devoted workers eager to carry on research at the headquarters of British surgery.

Scientific History of the College

Sir CUTHBERT WALLACE in accepting the gift and before asking Lord Athlone to declare the laboratories open gave a brief historical sketch. In March 1800, when the College had just moved to its present site and had received a new charter, its chief preoccupation was the housing and care of the Hunterian collection, making it accessible to students and practitioners. That collection was divided roughly into two parts, one concerned with the human body and the other with comparative anatomy. Owing to the amazing development of comparative anatomy in the first quarter of the nineteenth century the work of the conservators chiefly lay in that direction, but they used the collection as a mine from which to extract scientific material. The cataloguing alone took thirty years.

The next great phase in the scientific history of the College was the development of the pathological side of Hunter's collection. In 1847 Paget was appointed Arris and Gale lecturer, and it was he who laid the foundation in this country of surgical pathology. His work and later that of Shattock created a national type collection of pathology in the College museum. Coming down to 1890 the President recalled the establishment, in conjunction with the Royal College of Physicians of research laboratories in a building on the Victoria Embankment. Of these Sims Woodhead was appointed director and later T. S. Brodie. Unhappily want of funds brought this adventure to an end, but the two Royal Colleges turned in another direction, and under their aegis in 1902 arose the Imperial Cancer Research Fund with E. F. Bashford as first director—the institution which having outgrown its former habitations was now seeking under its present director Dr. W. E. Gye a new home at Mill Hill. The College also in these years had seen its museum under the inspiring influence of Sir Arthur Keith become a centre of physical anthropological research. Again under the presidency of Lord Moynihan the old laboratories in the College had been enlarged and a policy inaugurated of bringing the College more intimately into contact with outstanding surgical problems. Another development was the Buckston Browne gift of £100,000 which provided the College with a field laboratory and bench space for the increasing number of students.

The very efficiency of the Buckston Browne Farm had made the town accommodation appear poor, and therefore the Council determined to remodel and enlarge it so that both the museum and the research activities should be properly housed. Thereupon the Director of Research Professor Beattie obtained information about recently erected laboratories in this and other countries, and with the knowledge so obtained a laboratory was planned worthy of the College and its work. Money only was lacking for the achievement of their ambitions. Then to their help came the Bernhard Baron Trustees with the gift now so gratefully accepted.

As to future plans it was desired to create a school of experimental surgery to train young surgeons in the technique of investigation and in scientific outlook. He acknowledged the help which various outside bodies had given to some of the College research workers—the Medical Research Council by grants in aid, the Rockefeller Foundation by a large gift, the Beit trustees by the election of a scholar to a fellowship. Happy relations had also been maintained with the Ministry of Health.

In conclusion Sir Cuthbert Wallace suggested that there might be inscribed on the portal of these laboratories the remark John Hunter made to Jenner concerning their mutual interest in the hedgehog: "I think your solution is just but why think? Why not try the experiment?" He asked Lord Athlone in the name of the Members, Fellows and Council to declare the laboratories open.

juice given to ten healthy infants restored to normal in six instances a capillary resistance which was previously low The large number of infants under 6 months of age with lowered capillary resistance is held to indicate that they are receiving too little vitamin C Dr Braestrup has also investigated[1] the content of ascorbic acid in the blood of women in labour and of babies at birth, the samples in the latter being taken from the umbilical vein It was found that women in labour had as a rule a lower level of ascorbic acid in the blood than is generally accepted as normal The levels in the samples of umbilical blood were considerably higher than in the mother's blood, in both the full-term and the prematurely born infants There appears to be a definite relation between the level of ascorbic acid in the blood of the mother and of the infant and if this acid is administered to pregnant women the level of ascorbic acid in the umbilical vein of the infants subsequently born can be raised above the average otherwise found These two investigations suggest that the diet of pregnant women and nursing mothers can easily be relatively deficient in vitamin C and in consequence latent scurvy is present in the early months of life The absence of evidence of this in the first few days of life however, remains unexplained

TRICHINOSIS

Trichina spiralis is a parasite which goes through its entire life cycle in one host, which may be the pig or the rat or man The small adult worm develops in the intestine and produces large numbers of larvae, which circulate in the blood and come to rest in various tissues those in muscles become encysted and infestation is the result of consuming incompletely cooked meat containing these cysts We are not apt to think often of the disease in this country though cases are occasionally diagnosed and more probably occur which are not It is therefore somewhat astonishing to be told that in the United States there are many millions of infested persons among whom several hundred thousand must have had an infestation heavy enough to cause recognizable symptoms although the number of cases actually diagnosed annually is only a few hundred These facts are deduced by Hall and Collins[2] from studies of the frequency of trichinosis in post-mortem material collected in a variety of centres and fairly representative of the whole population of the country The material examined was diaphragmatic muscle, a portion of which was compressed between glass plates and inspected microscopically (a much more delicate test than sectioning), while a larger amount preferably almost the whole of the diaphragm was digested, the residue being examined for cysts The simple fact emerging from this investigation is that about 12 5 per cent of all cadavers in the United States show trichinosis, the number of cysts varying from less than one to many hundreds per gramme of muscle Modern factory methods of handling pork which involve the dilution of infested meat with large amounts of uninfested and its consequent distribution among many consumers evidently account for the widespread occurrence of minor degrees of infestation The chief danger is from garbage fed swine, and apparently the actual source of the parasite in garbage is not the rat —since, in spite of frequent contrary assumptions, swine rarely eat dead rats—but pork refuse, either domestic or from the slaughterhouse Grain-fed animals and those grazing in open country are rarely affected, and in districts where swine are raised under these more sanitary conditions the human incidence of the disease is lower Prevention is therefore mainly a question of cleaner pig-farming since neither meat inspection nor the usual culinary treatment of some types of sausage constitutes an effective barrier The classical symptoms of trichinosis in man are gastro intestinal disturbance followed by muscular pains and fever, these are ordinary enough, and may well excite no suspicions of the true diagnosis but apparently the picture can be more varied and hence confusing, with either pulmonary or cerebral symptoms predominating The authors of the four remarkable papers containing this and other information about trichinosis in the U S A strongly recommend that a "press preparation" of diaphragmatic muscle should be made as a routine measure at all necropsies In a paper by V D van Someren on page 1162 of the present issue of the *British Medical Journal* it will be seen that an investigation of this matter has already been undertaken in London, and among 200 specimens examined both directly and by digestion only two examples of infestation were found The author's review of the records of trichinosis in this country gives the impression that the disease must be exceedingly uncommon and his account of the regulations applicable to pig farming and to the importation of bacon reveals that almost every possible measure has been used to prevent its occurrence

THE MEDICAL DIRECTORY, 1938

The ninety fourth edition of the *Medical Directory* published this week at 36s by Messrs J and A Churchill fully maintains the standard of its predecessors in respect of accuracy and skilful compression Growth of material has added forty to the number of pages of this invaluable reference book Turning to the numerical summary of the medical profession, which faces the table of contents we find that the names now number 59 858, being an increase of more than 1 100 over last year's figure and of 15 500 since 1920 By far the largest part of the present increase (536) has taken place in the provinces which now contain 25,550 medical practitioners In London there has been an increase of nearly 200 and in Scotland of more than 100 The entries under "Abroad" number 10 501, being an increase of 165 and there are slight increases in Wales and Ireland and in the 'Services section The "Late List" of new names changes of address etc, appears at pages 2262–2265

Help for the Research Worker

Lord ATHLONE mentioned that it was now fifteen years since, under the inspiration of the late Sir John Bland-Sutton, he began to take an active interest in the College, and he had gladly accepted the invitation to become a trustee of the Hunterian collection He knew that great philanthropist, the late Bernhard Baron, very well, and was sure he would approve of the gift his trustees had made Research was essential for increased medical and surgical knowledge, by such increase of knowledge the greatest benefit might be secured for the greatest number through the improvement of methods of preventing and treating disease Having inspected the new laboratories, he congratulated the Council and the Building Committee on the use made of the space available and of the funds placed at their disposal He also congratulated Professor John Beattie on the ingenious way in which he had planned his equipment He had been particularly struck by the economical arrangement and flexibility of his laboratory units, providing as they did for rearrangement with the minimum of expense and disturbance to meet changing requirements

'It is comparatively easy (Lord Athlone continued) "to provide laboratories but it is not so easy to find the men of genius to work in them When we do find such men it is our duty to provide them with every facility for their work, and what I fear is sometimes neglected, the wherewithal to live without financial anxiety, not only during their active working days but in their years of retirement I take every opportunity of urging that there should be adequate endowments to provide for those scientific men who give their lives to the service of mankind by devoted and patient research

I doubt not the provision of these laboratories will attract workers from all parts of the Empire and that their work will inspire gifts for the endowment of research I pray that the outcome of their labours will speedily bring increasing relief to suffering humanity'

What Lister would have Thought

A vote of thanks to Lord Athlone was proposed by Sir CHARLES SHERRINGTON who said that this was a most significant day in the history of the College, and the presence of Lord Athlone had endorsed its importance

There stands on the College stairway up to the library and the Council room a bust in marble [Lister] A face at once genial and grave It is the face of one who in the words of our own President, freed the hand of the surgeon. He freed it to the extent of saving millions of lives throughout the civilized world, and suffering untold He served on the Council of the College through some of the best years of his life Some of us can remember the calm earnest voice He would have been radiant-to-day He would have rejoiced that there was opened here to the young surgeon this opportunity for pursuing in the laboratory the inquiries which practical observation by the surgeon prompts He could I think, hardly have refrained from telling us what difficulties he had when he was young because such laboratories were not'

The great collections, finely housed and preserved within the College, Sir Charles Sherrington continued, were justly famous in Europe and all over the world No more fitting adjunct could have been made to them than the laboratories opened that day under the same roof Those collections with their splendid material for study were really a flood of questions Some of the questions were answered by the collections themselves, but many others were not A large number of them were only to be answered by experimentation in the laboratory They were questions which recurred weekly daily in the sick-room, in the nursing home in the hospital ward Under the able direction of the laboratory at the College such inquiries were already being successfully pursued, but the increased facilities given by the new Bernhard Baron laboratories, under the same able and skilled direction, would prosper the work still further The value of them which was foreseen that day would be falsified in years to come, but only in the sense that the future would prove it greater than any of them thought In opening these laboratories Lord Athlone had symbolically been opening scientific inquiries, and as representing the University of London he would feel that there was hardly a higher cause he could promote

At the end of the ceremony the laboratories were open for inspection

Description of the Laboratories

The laboratories are located on the sixth, fifth, and fourth floors of the College building On the top floor is the animal room, where great pains have been taken in design to facilitate cleanliness and the maximum amount of light and air Cages are carried on trays suspended from the roof The director's room and a common room for the research staff are also on this floor, together with two small laboratories On the floor below are laboratories for isolated organ and perfusion experiments, for electrical recording, for experimental work with the use of kymographs, and for histological and biochemical work, as well as preparation room and workshops Here also are the drum-smoking room for the preparation of recording paper, the operating suite, the sterilizing equipment, and the instrument cupboard and x-ray viewing screen, both these latter built in By means of microphone and loud speaker, telephonic conversations can be carried on without the necessity for touching any non sterile object Another provision is for the filtration of the air of the theatre by a fan in the sterilizing room

On the lowest of the floors devoted to the laboratories are the pathological laboratory and preparation room, the mounting and articulating room, the x-ray and photographic departments, and the laboratory of the assistant conservator One feature of the whole equipment, as Lord Athlone remarked at the opening, is that the laboratory furniture is made in interchangeable units to allow of the rapid remodelling of rooms to suit the work going forward Gas plugs are used instead of taps, and the electric power outlets are grouped so as to provide ample supplies of power when necessary for experimental work It was mentioned that the laboratory furniture and the operating table have been built to designs prepared by members of the College staff

Although in its scientific planning ideas have been drawn from all sources, the materials used in the construction of the building are as far as possible of home or Empire origin The timbers have come from Canada, Australia—Jarrah wood flooring in the laboratories and corridors—Rhodesia, India, and Burma

The laboratories will accommodate thirty workers

The use of cinematograph films to give instruction in safe methods of working is being advocated by the Industrial Welfare Society and the National Safety First Association These two organizations are attempting as part of their joint accident prevention service, to establish a film library from which firms can hire safety films for exhibition to their employees The films will be of three kinds general propaganda films, instructional films showing employees the safe way of performing specific operations, and technical films showing the latest developments in safety engineering, such as new types of guards Examples of all three kinds of film were shown at a recent meeting attended by members of about fifty interested firms, as well as by members of the Factory Department, the Mines Department, the Board of Education the London County Council, various insurance companies and other bodies

SURGICAL PROCEDURES IN GENERAL PRACTICE

This is one of a series of articles contributed by invitation

MINOR SURGERY AND THE GENERAL PRACTITIONER

BY

NORMAN C. LAKE, M.D., M.S., D.Sc., F.R.C.S

In the series of articles to which this is a prologue it is proposed to deal with those aspects of surgery which come within the purview of the general practitioner. The term "minor surgery" is usually employed to describe such matters, but this is a relative term, and there is no agreement regarding its limitations. An operation which might appear to be but a minor part of the work of a consulting surgeon might equally impress the practitioner as a major procedure when he tackles it himself. And a minor operation undertaken by anyone may, owing to unforeseen circumstances, become major. Nevertheless there is a large section of medical practice which we should all agree to include under this heading.

The amount of minor surgery undertaken by the practitioner will of necessity depend upon many factors. The doctor's liking and aptitude for surgery, the holding of a house surgeon appointment in a hospital, his geographical situation in relation to hospital facilities, and the frequency with which he is provided with opportunities for practice, will all affect his attitude. One point, however, needs emphasis: it is a great mistake to look upon minor surgery as work which anyone can undertake without careful consideration of all the circumstances of the case and the display of quite a lot of knowledge and skill. The removal of a sebaceous cyst or ganglion may not appear to the uninformed to necessitate any specialized knowledge or skill, but there are right and wrong ways of performing such a simple operation as this. Properly done the operation may last but a few minutes and leave a perfect wound which heals rapidly; improperly done the removal may entail a tedious dissection lasting half an hour or more, with all the added risks of a slowly healing infected wound and subsequent disability. The economic loss following a badly treated septic hand or unskilfully set fracture is usually much greater than that which follows a corresponding lapse in the performance of a major operation in the abdomen.

Ultimately, therefore, the practitioner's own conscience must be the arbiter as to whether any particular part of minor surgery falls within his province. He should always ask himself the question: Can I offer this patient as good and skilful treatment as he could obtain elsewhere? The answer can obviously only be given if the doctor is kept informed concerning the standard practice of the day, and it is to help him in this regard that these articles have been planned.

The Question of Equipment

One difficulty which I find confronts the practitioner in relation to minor surgery is the question of equipment. To fit up one's surgery as a small out-patient operating theatre may be the ideal of the embryo practitioner, but it is often quite beyond his immediate financial resources. It must be remembered however that sumptuous equipment is not essential to the performance of really first-class work, so long as the necessities are available, the junior practitioner can gradually acquire the more expensive and less used items of his "plant" provided that he starts with a suitable nucleus for emergencies.

For those who have already collected a fairly complete equipment the question of its maintenance in perfect order looms large. Some of the materials or instruments may be used only at long intervals and, having deteriorated in the meantime, fail when an emergency call is made upon them. There can be no doubt that commercial enterprise has made this aspect much less of a problem than it was to a previous generation. The introduction of stainless steel in the manufacture of surgical instruments may be taken as an instance of this: no longer are the artery forceps hung unused for a time, found to be rusted at the joint and useless, or the aspiration needles corroded to the danger point with the stylet firmly rusted in. The packing of sterilized suture and ligature materials in preservative fluids in sealed tubes is another great advance which has removed an ever-present difficulty in the infrequent performance of minor surgery. In the past the practitioner dare not employ any suture material which could not be boiled immediately before the operation, sometimes to the great detriment of its tensile strength, and so was limited to silk, horse hair, and the like. Now he can obtain all grades of catgut and other absorbable materials threaded or unthreaded in tubes which preserve the original qualities of the material almost indefinitely. The packing in ampoules of sterilized anaesthetic solutions for local application is a further example of the facilities offered by the modern manufacturer.

The Care of Instruments

Another aspect of maintenance is the necessity for keeping sharp all cutting instruments—scalpels, scissors, and needles. Scalpels may now be obtained made of special stainless steel the temper of which is almost as good as that of ordinary carbon steel, these of course, maintain their edge under adverse conditions of storage. The introduction of the 'wafer blade' scalpel has, however, tended to replace the solid forged pattern, especially for the type of work involved in minor surgery. The practitioner is thus saved the trouble of sending his knives to be sharpened, and provided he attends to his stock of blades can always rely upon a sharp scalpel. Many nevertheless still prefer the feel of a solid knife and for these it may be of some interest to know that the cutting edge is not usually seriously damaged in an operation invading soft parts only, provided other instruments are not allowed to rub against it and that regrinding is not necessary to restore its efficiency. Even honing may not be required, the passage over a rigid leather strop prepared with a suitable razor dressing—or, for the more skilled, over a lead 'lap' impregnated with emery flour or finest carborundum—being all that is necessary. The shearing edge of a scissors blade is easily restored by honing at the correct angle; for those less mechanically minded a small automatic carborundum sharpener may be obtained. Scissors for surgical purposes are now best made of stainless steel and to ensure sterility these may be boiled without fear of deterioration.

Needles are particularly important and if the practitioner is not opulent enough to afford a fresh needle for every case he should keep the cutting edge keen by

CROYDON TYPHOID INQUIRY

OPENING PROCEEDINGS

The inquiry to examine the causes leading to the outbreak of typhoid fever in Croydon was opened at the town hall on December 6 amid obvious signs of great public interest The inquiry was held by Mr H L Murphy K C with whom Sir Humphry Rolleston Bt and Mr H J F Gourley a civil engineer sat as assessors At the outset the chairman expressed profound sympathy on the part of his colleagues and himself with those who had been the victims of the outbreak more especially those who had lost relatives and friends

Sir Walter Monckton K C and Mr H M Pratt represented the Croydon Corporation Mr P E Sandilands K C and Mr Geoffrey Howard represented the medical officer of health Dr O M Holden Mr Sandilands explained that he and his colleague were instructed by Messrs Le Brasseur and Oakley on behalf of the London and Counties Medical Protection Society Mr Montagu Lyons K C and Mr Sylvester Gates represented the South Croydon Typhoid Outbreak Committee Other individuals or bodies represented were the London County Council the Wandsworth Borough Council the Coulsdon Caterham and Warlingham and Orpington Urban District Councils the Croydon Chamber of Commerce certain members of the staff of Croydon Corporation and the Hertfordshire Branch of the National Farmers Union this last to watch the interests of the watercress industry The chairman said that he hoped those who desired to give evidence would do so through one or other of the bodies represented but opportunity would be given to other witnesses He also said that if counsel desired to call material witnesses who would not appear without a subpoena the tribunal would consider a method to enforce attendance He and his colleagues proposed at once to visit certain places in the borough and he suggested that counsel for the corporation and for the unofficial committee should agree upon a neutral guide

A member of the public who said his name was Stroud complained that his proffer of evidence had been refused He had made a study of rural areas in southern England and had found that the Ministry of Health allowed cess pools to be built in a most disgraceful manner infringing the by laws The chairman said that he had received a letter from this gentleman which appeared to relate to outbreaks of diphtheria in the Kesteven division of Lincolnshire and as he had no evidence to give as to conditions in the borough of Croydon he refused to allow him to proceed In reply to Mr Stroud who said that the inquiry ought to be a much bigger thing the chairman said that the inquiry was limited by instructions and to the remark Who appointed you? Was it the Ministry of Health? he replied You can ascertain that for yourself quite easily

A Request for Adjournment

Mr Pratt in the absence of Sir Walter Monckton asked for a fortnight's adjournment He said that it was essential to have the presence of four gentlemen if the case for the Croydon Corporation was to be properly presented —namely the medical officer of health the borough engineer the town clerk and Dr E V Suckling consulting water analyst and bacteriologist who since November 11 had been assisting the corporation The time of all these gentlemen was at present greatly occupied in dealing with the outbreak The medical officer of health had to keep in touch with all the cases of typhoid and 80 per cent of them were under his immediate supervision The borough engineer was still engaged on the continuous chlorination of the water supply the cutting out of one source the Eddington well had thrown considerable strain on the water resources and the transfer of water supply for a number of properties to other sources presented technical problems The town clerk was fully occupied with the daily meetings of the emergency committee set up by the corporation Dr Suckling was engaged in daily analysis of the water supply and was pursuing his investigations into the cause of the outbreak moreover other water authorities concerned as to their sources of supply were calling him into consultation The inquiry into the cause of the outbreak was still proceeding and the more time that was allowed for this purpose the more likely it was that adequate information could be placed before the tribunal

Decision as to Procedure

The chairman and Mr Lyons both said that they had hoped for not more than a week's adjournment After some discussion it was agreed that the inquiry should begin its full sittings on December 20 sitting from day to day including Christmas Eve if necessary The chairman said that it must be understood by the public that the adjournment was asked for by those who appeared before the tribunal and who showed compelling reasons and was not due to any difficulty on the part of his colleagues or himself in pursuing the inquiry immediately A representative of the Chamber of Commerce urged that a bad impression might be created if the case were left over Christmas part heard The chairman however said that he hoped that at an early stage some reassuring statement might be made

Mr Pratt desired to put in a statement as to the actual condition of the Croydon water supply at the moment The material at present before those instructing him confirmed their original view that the infection was water borne Since November 11 the corporation had had the advantage of the services of Dr Suckling who said that he was satisfied that since the date when he was called in the public water supply of Croydon had been bacteriologically pure and wholesome and suitable for drinking and domestic purposes Mr Pratt also stated that publicity had been given to the possibility of watercress as a medium of infection He was instructed to say at the earliest possible moment that no suggestion had been made that the outbreak of typhoid had anything to do with watercress

The proceedings were then adjourned

S Graff (*Disch med Wschr* September 3 1937 p 1357) who is in charge of the pathological institute of a hospital in Barmbeck Hamburg believes that in every infectious disease there is a primary infection with a primary focus or complex such as has already been demonstrated in the case of tuberculosis In his search for primary complexes he has for years systematically conducted special post mortem examinations of the neck in the hope of locating the primary complex in cases of measles He has at last succeeded in the case of a child aged 4 years whose death on the forty third day of an attack of diphtheria was due to paralysis of the limbs and respiratory system The post mortem examination of the neck revealed considerable enlargement induration and faintly brown discoloration of the upper cervical lymphatic glands on the left side The retropharyngeal lymphatic glands on both sides showed similar changes A microscopic examination of the enlarged cervical lymphatic glands revealed a great number of multinuclear giant cells whose association with measles has already been pointed out by various observers Fifteen days before the child's death another child in the same ward had developed measles As the child exposed to infection by this case had not had measles an intramuscular injection of the mother's blood had been given as a protective measure It had however not prevented the development of what Professor Graff considers to be a measles primary complex

means of an "Arkansas slip" curved along the edges to suit the so-called 'bevel' of the particular size of needle in use The latter is held transversely to the slip and its cutting surface is drawn along the curved edge a few times after each use of the needle By the application of such simple measures I have kept spinal needles keen for many hundreds of spinal anaesthesias, a type of puncture which sometimes provides a particularly gruelling test of a needle s point

Once the knack has been acquired these methods take very little time, and the practitioner may be saved the need for duplication of many of his instruments, for they will not be out of action at the instrument makers when required for an emergency

Of the other instruments employed in minor surgery syringes perhaps require most attention The Record type is now very popular, but owing to the intimate contact of metal ends with a glass barrel great care is necessary in their sterilization by boiling, or the difference in the coefficients of expansion of the two materials will cause a breakage For many purposes the cleaning of a syringe with ether (methylated) and industrial spirit after use and its immersion in the spirit again before the next occasion is all that is required, provided the spirit be thoroughly removed before use It must be emphasized that this method is not to be relied upon when a single syringe is employed for many purposes—for example, the aspiration of infected fluids and the injection of sterile solutions, here prolonged boiling is essential For this reason it is an economy to provide a series of syringes, some of which are kept exclusively for the injection of sterile fluids, such as local anaesthetics, etc the method of spirit sterilization has proved to be quite satisfactory under these circumstances

Antiseptics

Lister was able to perform the most extensive and delicate operations with remarkable success with the aid of a chemical antiseptic for all purposes, a fact which in these days of high-pressure superheated steam sterilization we are apt to forget The country practitioner, with no modern facilities, can repeat Lister s success in his minor surgical operations by the proper and efficient employment of chemical antiseptics It is unlikely that he will follow Lister to the extent of using carbolic, but there are many other reliable antiseptics which, in concentrated form, can be carried in the instrument bag and utilized for the sterilization not only of instruments but also of towels, swabs, etc Here again, however, commercial enterprise has come to the help of the doctor, for he can get hermetically sealed 'drums' of sterilized dressings, gowns, towels, and so on, which can be stored indefinitely without deterioration and used as required

Splints, Specula, and Sterilizers

In the case of fractures the practitioner requires to know what the minimal equipment in splints should be The majority of these cases are not so urgent, apart from first-aid measures, that the doctor has no time to send to the splint-maker for the appropriate appliance if it is of a specialized nature, but luckily there is a growing tendency to use plaster splints in one form or another As plaster bandages are now put up in sealed cartons which keep them in good condition for long periods the practitioner may easily be prepared for the emergency case without the necessity for a large collection of splints With the display of a little ingenuity it is possible to build up plaster splints for the retention of almost every fracture in the body Details of such methods will be given in later articles in this series

Since certain minor procedures are performed through specula—for example, injection of haemorrhoids, myringotomy, etc—and since in any case accurate pre operative diagnosis demands the aid of vision where possible, the doctor s equipment must include at least aural, nasal, vaginal, and rectal specula It is advisable that all of these should be electrically illuminated, and complete sets, including an ophthalmoscope, are now readily obtainable

An instrument sterilizer will certainly be necessary now that electric power is so universally available the most convenient type for the surgery will be one of the modern efficient and reliable electric sterilizers For the instrument bag, however, a simpler type which can be placed on the fire or gas-ring is advisable, while in emergency the classical fish-kettle or the humble enamel saucepan may be pressed into service

The Instrument Bag

Which articles of the equipment should be carried in the instrument bag will depend upon the particular circumstances of the practice, and can be decided upon only by the individual practitioner, but there are certain instruments which should never be omitted, they are those found in the ordinary "dresser s case"—that is, two or three artery forceps, dissecting forceps, a scalpel, a pair of scissors, a probe pointed director, and straight and curved needles The shape and size of the scalpel are largely matters of individual taste, but the well-bellied scalpel employed in major surgery is not so generally helpful in minor cases as the pointed shape It should be of medium size even for small operations, since too small a knife is always difficult to control The standard shape has a 'fish tail" handle, and this will be found of use for its intended purpose—namely, blunt dissection If the "set" is to be extended to include several scalpels consideration should be given to the inclusion of a Syme s abscess knife This instrument, which many now regard as obsolete, was designed to be used in the reverse manner to the ordinary knife—that is, cutting from below to the surface It is sharp-pointed and curved so that the base of the abscess can be readily penetrated Its object is to do away with painful downward pressure on a tender area—and I can speak from experience of its efficiency in this regard Like many other good instruments, it has fallen into disuse from ignorance of its intended purpose, combined with the increasing employment of anaesthesia for the smallest incisions If one pair of scissors only be carried it should have one blade sharp and the other blunt, the former being necessary for the removal of sutures

The instrument bag must of course include syringes, local anaesthetic solutions, intravenous anaesthetics such as evipan the case of specula, a portable sterilizer, tubes of suture materials and ligatures, and a few rubber and gum elastic catheters with a tube of antiseptic lubricating jelly Metal catheters are very rarely necessary, and unless the practitioner is especially skilled in their manipulation are best avoided altogether

The Use of Gloves

Finally there arises the question of gloves Many small operations can be performed without them if care is taken that the operator s skin is healthy and that the hands are sterilized as far as possible by the use of antiseptics, preferably of a spirituous nature, there is

Reports of Societies

SURGERY OF THE HEART

Professor Sauerbruch's Lecture

At a very largely attended meeting of the West London Medico Chirurgical Society—the most largely attended, it was said, in the Society's history—on December 3, Professor FERDINAND SAUERBRUCH of Berlin discoursed on "Surgery of the Heart." Dr D G RICE-OXLEY was in the chair.

Professor Sauerbruch said that surgery of the heart was one of the most recent developments of medical research and its achievements were already more than justified. It gave hope of surgical relief to many patients at present condemned to an early inevitable death. The method was the result of a careful co-operation between clinical and experimental work, and its further advance could only come about in the same way. It must be emphasized that the operation of cardiac repair was not to be undertaken in all cases; moreover, it must be admitted that some cases which had been successfully operated on might have healed without the intervention.

When a stab wound was inflicted on the heart three events were possible. The wound might close at once as a result of local thrombosis; there might be profuse haemorrhage through one or other pleural space so that death rapidly followed, or there might be an accumulation of blood within the pericardial sac. One of the most important indications for operative relief was cardiac compression, a frequent cause of death after wounds. The limits of elasticity of the pericardium were soon reached, so that the continued accumulation of exudate exerted pressure on the heart itself, and a point was reached when the venous return was totally arrested. There had been cases in his clinic in which a timely puncture of the pericardium had sufficed to relieve the condition, both after trauma and in blood-borne infections. In fibrous adhesive pericarditis the inflammatory process might extend towards the heart along the mediastinum and pleura, the pericardium losing its normal elasticity. The heart itself might remain free and for a long time be able by increased activity to compensate for the mechanical handicap which loss of the normal elasticity of the pericardium imposed. When this compensation was no longer possible death occurred unless surgical help was given. He had been astonished to observe the marked interference with cardiac function which might result even from a few isolated adhesions between the pericardium and the chest. The heart, held by an unyielding ring, could no longer accommodate itself to the necessary change in volume at the various stages of cardiac action. It was especially the right auricle which was impaired, and this impairment determined the clinical picture, for the inflow through the great systemic veins could no longer proceed normally. Once this point was reached surgery alone could offer relief. The pericardium must be exposed and the heart freed from the constricting membrane which surrounded it. Sometimes no cure could be obtained because the heart muscle, when freed from the adherent pericardium, was found to be the seat of fibrous degenerative processes. But some most brilliant successes were on record: patients who had been long bedridden being restored to full activity.

Mechanical Factors impairing Heart Function

As surgery advanced more and more was learned of the method of relieving mechanical factors which impaired cardiac function. It had been observed how paroxysmal tachycardia might follow the pressure of a tampon which had been left in the region of the heart after a mediastinal operation, and how immediate was the return to normal rhythm when the tampon was withdrawn. Tumours of the mediastinum might produce similar effects.

A young man was admitted to the clinic following an accident in which he had received a severe blow on the left side of his chest. There was no external injury but there was a rapid and unequal pulse. After fourteen days in bed his cardiac disquiet did not diminish. A ray examination showed a sharply defined shadow on the left side immediately above the heart, a diagnosis of mediastinal cyst was made and an operation performed. The walls of the cyst were found infiltrated with blood and within it was a large haematoma. The heart irregularity immediately disappeared, and the patient was well to-day.

Experience of this and other cases had shown the necessity for carefully watching for a mechanical cause—tumour, abscess, effusion, hernia—in all cases of obscure cardiac dysfunction. The results of the various operations were convincing and the mechanical principles on which they were based were comparatively simple. The position was different in the case of surgical relief of heart disease itself. From the experimental animal it was a long step to a patient in the state of heart failure, and although some of the early experimentalists were successful in operating for mitral stenosis in the dog, most of the human operations had been failures. Professor Sauerbruch adopted the most reserved attitude towards all operations on the valves of the heart, yet he hoped that further work would enable at least an occasional patient to be saved from premature and unnecessary death.

Surgical treatment of angina pectoris had attracted attention in recent years. The syndrome often lacked a clear pathological basis. Pain of an identical nature might be produced, for example, by pulmonary disease. Various surgeons had tried the severance of connexions between the heart and the central nervous system, but several arguments might be advanced against the wholesale exploitation of this branch of sympathetic surgery. It must be remembered that in addition to conducting pain impulses from the heart there were other important functions of the nervous connexions which must be impaired if reckless interference were undertaken. Mr O Shaughnessy, however, had done much to put this work on a more rational basis, and had shown what was possible by means of omental grafting.

The lecturer proceeded to discuss palliative operations for aortic aneurysm. A large aortic aneurysm was sometimes seen which had forced its way to the chest wall until the sac was just under the skin. The wall of the sac in such a case might be reinforced by the introduction of fascial grafts, and a fatal outcome deferred. There were other cases where a large aneurysm caused almost intolerable distress by reason of pressure. In such cases by splitting the sternum a decompression operation had been carried out with good results, giving the patients some years of relief.

A girl aged 19 suffered from cardiac symptoms. On radiological examination a sharp definite shadow was seen in the region of the heart on the right side. It was decided that the cardiac disturbance was caused by the pressure of a cyst. An exposure was made, and after needling no fluid being withdrawn the spurting of blood on removal of the needle made it clear that a great vessel of the heart or an aneurysmal sac had been entered. Attempts were made immediately to close the puncture. The suture fell out and there was a sudden violent rush of blood from the tumour. He felt a hard ring behind which another cavity might be entered and the bubbling and whirling of the blood left no doubt that this was a chamber of the heart. The assistant placed on his fingers two strong ligatures and as the fingers were withdrawn the ligatures were tightened and the bleeding was thus controlled. The only method of ensuring permanent closing of the wound already ligatured was excision of the sac. The sac was excised and repair by suture effected. Following the operation a pulse rate of 140 to 180 persisted for some time but after eight weeks the patient was up and to day, seven years after operation she remained well and free from symptoms.

He did not propose to repeat such an operation deliberately, but it furnished a proof that such desperate

interference could succeed He closed with some graceful words of compliment to his friend and pupil, Mr O Shaughnessy

The Work at Lambeth

Mr LAURENCE O SHAUGHNESSY recapitulated the work on which he and others had been engaged at Lambeth Cardiovascular Clinic His interest had first been awakened in the clinical syndrome of the racing greyhound, and with the help of Sir Frederick Hobday and Professor McGunn he had been able to carry out a decompression operation on dogs and the animals improved, some of them running again without distress

It then occurred to Mr O Shaughnessy that if the greyhound would not merely tolerate a cardiac graft, but actually benefit from it the application of the operation to man should be a practical possibility After showing some histological serial sections illustrating the junction between the graft and the heart, he said that one recent development at the clinic was the abandonment of a standard operation and the adoption in its place of a series of operations, some of them of lesser extent, enabling the procedure to be modified to suit each individual case The essential point was that revascularization should be carried out in one way or another but of course only in those cases where Nature had failed to supply an alternative blood supply herself He thought he could say that all the survivors of six months or over were better, in the sense that those previously unable to work were at work again and those bedridden were now walking about One man had bought a bungalow because he could not mount the stairs of a house and had sold his car because he could not drive it Since treatment he had bought a new house with stairs and a new car, which he drove himself One woman patient returned to the hospital a year after her operation, but not for the heart She was in now for hysterectomy whereas a year ago so feeble was her cardiovascular system that her fibroids had caused her no distress He added that the operation was carried out in the Lambeth Clinic only after careful consultation with the clinic staff, and that the good results obtained in many cases were not so much due to the operative technique as to the careful pre operative observation and more particularly the unremitting medical care which the patients received after operation

There was no discussion but Dr J F MCCANN in German, and Dr L S T BURRELL expressed appreciation of Professor Sauerbruch s work

BRITISH ORTHOPAEDIC ASSOCIATION ANNUAL MEETING

The annual meeting of the British Orthopaedic Association was held in Sheffield under the presidency of Mr W R BRISTOW On the morning of October 29 Mr Bristow delivered his presidential address, taking as his title, 'Orthopaedic Surgery—Retrospect and Forecast Clinical demonstrations were given in the out patient department of the Sheffield Royal Infirmary and Mr R W BUTLER (Cambridge) showed a continuously adjustable bed for the correction of spinal kyphosis Also on the morning of October 29 and again on the following day a series of short papers were presented

Treatment of Minor Injuries—Mr W G CAMPBELL (Dundee) gave a detailed account of the early treatment of strains of ligaments and muscles by the injection of a local anaesthetic into the site of tenderness It was assumed that Leriche s conception of strain was the right one—namely that there was no tearing of ligamentous fibres but that impulses passing from the affected area began a vicious circle of local vasodilatation deposition of metabolites etc In a controlled series of patients Mr Campbell had found that treatment by this method had resulted in cure in about three days as compared with twelve days by the conventional methods of strapping, etc

Ossification of Ligaments of the Elbow joint—Mr ST J D BUXTON (London) stressed the frequency with which ossification of the ligaments followed joint injuries especially dislocations The amount of ossification that took place was governed largely by the treatment of the injured joint If rested for an adequate period (several weeks) no harmful degree of ossification resulted but if efforts were made too early to force movements then extensive new bone formation often occurred, and the mobility of the joint was seriously restricted for all time

Osteitis in Undulant Fever—Professor H N GREEN (Sheffield) reviewed the literature on undulant fever Bones and joints were often involved and abscesses formed but usually resolved quickly The x ray changes in the bony lesions were not typical and might resemble those seen in tuberculous disease Ankylosis of joints was rare and the general prognosis good

Principles of Joint Mechanics—Mr M A MCCONAILL (Sheffield) maintained that the chief function of the synovial fluid was to prevent friction—a function which was least active during the full coaptation of the joint surfaces in weight bearing Hence degenerative changes occurred most often in those surfaces which fitted best together Ligaments were not elastic and were so arranged that they prevented the harmful effects of torsion

End-results of Bone and Joint Tuberculosis—Mr J C SCOTT (Oxford) presented a preliminary report of a survey of 582 patients suffering from tuberculous disease of the spine and of the hip joint As far as possible the results of conservative treatment alone were contrasted with those of conservative treatment reinforced by operative measures The combined procedure appeared to have a slight advantage

Injuries of the Carpus—Mr J L GROUT (Sheffield) had investigated by means of x rays the wrists and hands of some thirty nine workers using pneumatic drills and chisels In a little less than half of the men small cyst-like spaces giving rise to no symptoms were found in the carpal and metacarpal bones Osteo arthritis of various joints was a common finding

Early Diagnosis of Malignancy in Bone Tumours—Dr J F BRAILSFORD (Birmingham) emphasized the difficulties of diagnosis in general and of x ray interpretation in particular In doubtful cases he preferred to be guided by serial radiographs, and differed from his surgical colleagues in condemning the routine use of biopsy If the latter was used the area from which the tissue was to be removed should be determined precisely by the radiologist

Nephrolithiasis occurring in Recumbency—Mr R GUY PULVERTAFT (Grimsby) gave an account of sixty patients who during long periods of immobilization in recumbency for tuberculous bone or joint lesions had developed renal calculi The factors responsible for stone formation appear to be defective renal drainage and the widespread skeletal and muscular decalcification Preventive measures consisted in frequent turnings of the patient, avoidance of excessive exposure to the sun and a generous fluid intake Only in a few cases was operative intervention necessary Usually the stones were passed, as gravel when the turnings were begun or when the patient became ambulatory

Arthrodesis of the Hip—Mr R WATSON JONES (Liverpool) described the technique of intra articular arthrodesis followed some ten days later by the closed introduction of a long Smith Petersen nail along the femoral neck and deeply into the ilium It was claimed that the combined procedure had greatly increased the chances of securing bony union A brief reference was also made to the method, still on trial of fixing the osteo arthritic hip by a long Smith-Petersen nail introduced through a short incision without a preliminary denudation of the articular surfaces This procedure was obviously more easily applicable to older people than was the combined operation, and the results so far had been encouraging

Coupons for Medical Charity

SIR—Your readers may be aware that two daily illustrated papers—the *Daily Sketch* and the *Daily Mirror*—are printing in every issue a coupon which entitles any approved charity to collect from the proprietors of those papers a fraction of a penny for each one presented There must be thousands of medical households in which these popular papers are taken in In some of these households, I expect, the coupons are already being collected on behalf of some charity or another

This letter is to inform your readers that the Sherman Bigg Fund, administered from these offices has been approved in respect of this scheme, and to ask every doctor to get some junior member of his household to cut out the coupons and send them here The Bigg Fund, I ought to say, is available for the relief of any sort of distress, and is mainly used for educational grants to medical orphans, both boys and girls, for whom the ordinary scholarships of the Royal Medical Foundation are not available or are unsuitable by reason of age and other causes—I am, etc.,

HENRY ROBINSON
Chairman

A Veteran's Thanksgiving

SIR—It was an agreeable surprise on opening a communication this morning from the Secretary of the British Medical Association to find it was not a reminder that my annual subscription would shortly fall due, but a notification that henceforth I should continue membership without further payments I know personally other members who will also much appreciate this action of the Council as they have felt—in some cases keenly—the fall in income resulting from investments etc since the time of their retirement It is a pleasure for me to increase my donation to the Royal Medical Benevolent Fund as a "thanksgiving" and I make the suggestion that if other members having this concession would do likewise it would be some help to the good work of that valuable institution—I am etc,

Sussex Nov 27

SENEX.

"Tissue-paper Face"

SIR—In the course of my work I have performed many transillluminations and have been impressed with certain appearances which are observed in some cases In one type of patient the whole face is illuminated so that one gets the impression that there is scarcely any bony structure One of my housemen described this appearance vividly as a tissue paper face Over a number of years it has been my experience that this tissue paper face is found in the highly neurotic I first made the observation when dealing with patients complaining of catarrh but being impressed by the absence of all cause for this condition I began to feel that the catarrh was more imaginary than real and to associate three conditions the complaint of catarrh, the tissue paper face and the fact that these patients were highly neurotic I wonder if the possible connexion in this respect might be an error in calcium metabolism a feature which is I understand commonly met with in neurotic states I bring forward this observation in the hope that others may contribute their experience or draw my attention to any previous work on it—I am etc.,

Obituary

DANIEL FREDERICK RAMBAUT, M D

Medical Superintendent St Andrew s Mental Hospital Northampton

The death on November 30 of Dr D F Rambaut, who for just upon a quarter of a century was medical superintendent of St Andrew s Mental Hospital, Northampton, has taken away one of the pioneers in this country of the modern treatment of mental disorder

Daniel Frederick Rambaut was born, the son of an Irish clergyman in 1865 and was educated at the Royal School Armagh at Trinity College, Dublin—where he obtained honours and prizes in logic and mathematics and the first place in his final medical examination—and in Vienna where also he distinguished himself Qualifying in 1892, he served for nine years as assistant medical officer at the Richmond Asylum Dublin now known as the Grangegorman Mental Hospital Even in those early days he introduced what is now known as occupational therapy In 1895 he installed hand loom weaving in that institution and also arranged for boot making and other employment for patients In 1902 he became medical superintendent of the Shropshire and Montgomeryshire Counties Asylum and in 1913 he was appointed medical superintendent of St Andrew s Hospital, Northampton the largest registered mental hospital in England where his main lifework was done

At Northampton Dr Rambaut was responsible for some noteworthy developments, which made St Andrew s a hospital with a hopeful outlook a place of objective nursing and treatment not merely of detention One of his innovations was the establishment of a large reception hospital (now called Wantage House) for the treatment of recent acute and curable patients who came to St Andrew s The building was approved by the Board of Control which recommended it to other hospitals, and it has been taken as a model not only in this country but over seas Since Wantage House was opened in 1927 St Andrew s has become more than ever a place of research in mental disorder on its curative side Dr Rambaut believed strongly that many mental disorders respond to physical treatment and under his inspiration some excellent results were achieved He devoted himself also to the better organization of mental nursing and the raising of the standard of the mental nurse, convinced as he was that the constant association of the patient with the nurse was a very important factor in the patient s recovery if recovery were at all possible The very appearance of St Andrew s the pleasant buildings and lovely grounds making it very unlike the popular idea of a mental institution owed much one imagines, to the progressive ideas and acute sympathies of the medical superintendent

Dr Rambaut was a member of the Royal Medico Psychological Association from 1894 onwards and its

MEDICO-LEGAL ASPECTS OF ABORTION

A discussion on the medico-legal aspects of abortion took place at a meeting of the Kensington Medical Society, held at St Mary Abbots Hospital on December 1. Dr JAMES FENTON was in the chair.

Mr W BENTLEY PURCHASE, H.M. Coroner for North London, in opening, said that the area for which he was coroner had a population of some 875,000, and he had brought to his attention, on the average, one case of criminal abortion every six weeks. Two out of three of such cases related to married women. Speaking roughly again, about half these criminal cases were said to be due to abortionists—that is to say, not self-induced. The annual number of deaths from criminal abortion in London must be between thirty and forty. Any case in which the word "abortion" appeared on the death certificate had to be reported to the coroner, but he need not necessarily order a post-mortem examination or hold an inquest. He himself, as a matter of routine, had the hospitals report to him all cases in which death had occurred within twenty-four hours of admission, and in that net some otherwise unsuspected cases were caught. On therapeutic abortion there had been a considerable amount of discussion, but he did not think that any doctor who had had reasonable grounds for performing abortion had ever been prosecuted, and the Director of Public Prosecutions bore him out in that statement. It had been suggested that the condition of therapeutic abortion should be regularized by the requirement that a second opinion—perhaps an official opinion—should be obtained. Some argued that therapeutic abortion should be limited to cases where it was necessary to save the life or the health of the mother, others would make it include mental health, and some would widen it to include all cases in which the woman did not wish to have a baby. He recommended the medical profession not to seek for a legal definition, which always had the effect of making a thing become inelastic.

Mr. Purchase passed in review various suggested remedies for countering the abortion-monger, including the suppression of advertisements of medicaments said to be efficacious and the prohibition of the sale of such products as slippery elm. One suggestion had been made that the law be altered so as to exculpate the mother in all circumstances, in the expectation that, having no fear of prosecution, she would expose the abortionist, but he thought the skilled abortionist would still find some means of escape, as it was, he was accustomed to say to the woman, "If anything happens, you know you did it yourself." In fact no woman was now ever prosecuted if it was thought that by refraining from prosecution the more reprehensible offender might be reached. He also discussed, but non committally, the arguments for and against notification.

Professor JAMES YOUNG said that there was nothing in the law at present which entitled a doctor to carry out abortion, and on the special committee of the British Medical Association which dealt with the subject evidence was brought forward that even distinguished obstetricians had felt hesitation in carrying out the necessary procedure in the absence of any legal cover for such interference. With regard to notification, he believed that the British Medical Association would strongly resist such a proposal, because it would impose upon members of the medical profession a burden they should not be called upon to bear. It was true that all measures of notification had been severely criticized on their introduction, and that gradually the public had become reconciled. But until the arguments for notification were much more convincing he thought it would be hopeless to expect the medical profession to fall in. Moreover, notification, because of its criminal implications (which did not apply in the case of such conditions as scarlet fever), might tend to make the evil more subterranean and sinister.

Dr LETITIA FAIRFIELD gave some statistics which she asked might not be published as they were to be presented to the Interdepartmental Committee. There was no reason, she said, to suppose that the number of abortions was increasing, although, on the other hand, in view of birth control propaganda it was rather remarkable that it did not diminish. Notification had obvious advantages in that it afforded a knowledge of the facts, which was badly needed, and, again, it would impress on the minds of women that miscarriage was not a trivial event for gossip with their neighbours and so would save a great amount of subsequent gynaecological trouble. But she doubted whether notification would work, and a law which did not work did more harm than good. As for the difficulty in the way of practising therapeutic abortion, she quoted from DIXON MANN's *Forensic Medicine* as far back as the 1908 edition: "... under certain conditions the necessity for the operation [therapeutic abortion] is unanimously admitted, and if the practitioner under such conditions acts openly he is held to be exonerated from the penalties imposed by the law." She thought the British Medical Association Committee had rather been "led up the garden" over the supposed difficulty of distinguished obstetricians in carrying out a necessary procedure because they were not legally covered. She was also against the suggestion that the second opinion in such cases should be an official opinion, which she thought would have certain drawbacks. On the general question of abortion she instanced the difficulty of reconciling the compassion which every humane person felt for women in certain circumstances, economic and other, with the broad grounds of public interest. On another side of the question, while herself a feminist, she pointed out that the husband had some right to be protected if it were proposed to concede to the wife an absolute choice as to whether or not she should allow her pregnancy to go on to the natural termination.

Mr V B GREEN ARMYTAGE said that abortion mongering was nothing new. Hippocrates denounced it, Plato and Aristotle condoned it, the ancient Romans allowed the husband to say whether abortion should be carried out or not, St Gregory started the papal outlook on the subject when he said that the foetus was alive from conception. The speaker thought the papal encyclical could not have envisaged the grave causes which might call for an artificial termination of pregnancy. Within the last twenty-five years he had lost eight Roman Catholic women, all because they had been refused, or had themselves refused, any interference. On the general subject of abortion he considered that any relaxation of the law would be a great mistake. Every family had its skeletons, and they would all be exposed if any legal countenancing of abortion were brought about. He thought that the war and the toll of motor accidents had given rise already to a dangerous public apathy on the sanctity of life. The case of Russia had been mentioned in the discussion. The real reason why the Russians had given up abortion was not because they wanted more soldiers to fight for Stalin but because of the gross amount of invalidism ensuing—he had been informed of 21 per cent. of chronic invalidism or sterility following abortions in Russia. In his view the only indications for abortion were medical, surgical, and psychical, and among the psychical cases he would include those of pregnancy following rape.

In the course of further discussion Dr H S PASMORE mentioned a series of some fifty cases at St Mary Abbots Hospital in which it was found that in 15 per cent. drugs only had been used, 59 per cent. douching, with or without drugs, 14 per cent. slippery elm, and 8 per cent. the passage of an instrument. A number of these women had been questioned on the subject of birth control. Out of twenty one single women and twenty-nine married women, neither partner had used any contraceptive measures in fourteen and sixteen cases respectively, and where contraceptive measures had been used they were inadequate. Dr H A NATHAN spoke of the need for control of

president in 1934 From 1897 until his death he was a member of the British Medical Association He was also a Fellow of the Royal Society of Medicine, Formerly he was examiner in mental diseases for the University of Dublin Although a man of great fertility of ideas, he expressed them in administration rather than in writing Forty years ago he was the joint author of an analysis of ocular phenomena in a large number of cases of general paralysis, which was published in the *British Medical Journal* and he wrote for the *Journal of Mental Science*

No account of Dr Rambaut's career would be complete without a reference to his prowess in sport and athletics In his undergraduate days he was a notable player of Rugby football for Dublin University and for Ireland He was also in his youth a champion hurdler, he was a cricketer of no mean ability, and after the age of 50 he took up hockey

A man of outstanding reputation in psychiatry, he never lost sight of the human factor, he was himself a most likeable man, and by those who knew him best he was most esteemed Many poor people in the Northampton area with some mental trouble found in him a friend, and he was beloved by his patients in hospital and by every member of the staff The affection he inspired was shown by the large numbers who attended the funeral service at All Saints' Church, Northampton, on Saturday last.

R L E DOWNER, M D

Obstetric Surgeon, Royal Salop Infirmary

We regret to announce the death at a nursing home in Birmingham, after a long illness, of Dr Reginald Lionel Ernest Downer, an outstanding member of the medical profession in Shrewsbury and the surrounding district. He was born in March, 1884, the son of Mr W J Downer, C B E, C M G, and was a foundation scholar of Highgate School He entered St Bartholomew's Hospital with an open scholarship in science in 1902, and took the M R C S and L R C P diplomas and the M B., B S Lond degrees in 1907, and the M D in 1912 After holding the appointments of house physician and house-surgeon at the Chester Royal Infirmary, he was for a time clinical assistant in the ophthalmic department at Bart's, and then served from 1914 to 1919 as temporary captain R.A M C At Shrewsbury Dr Downer steadily increased his reputation in the eyes of the public and the medical profession He was a first-rate all round practitioner, with special experience and skill in midwifery, which secured his appointment as honorary obstetric surgeon to the Royal Salop Infirmary, as obstetrical and puerperal consultant for Shropshire and the borough of Shrewsbury, and as puerperal consultant for Montgomeryshire He was also medical officer to the Post Office, the Board of Education, and the County Police and had charge for some years of the ante natal clinic at Shrewsbury Some time after the war he was appointed County Commissioner for the St John Ambulance Brigade and a serving brother of the Order of St John of Jerusalem He was a member of the Midland Obstetrical and Gynaecological Society, and of the British College of Obstetricians and Gynaecologists

Dr Downer joined the British Medical Association twenty years ago, and found time in the course of an arduous professional life to carry out the duties of honorary secretary of the Shropshire and Mid-Wales Branch from 1924 to 1936 His death at the age of 54 is a heavy loss to his colleagues and to the community he served so well

R B PURVES D S O., F R C S Ed

Surgeon Lincoln County Hospital

We regret to announce the death on December 4 of Mr R B Purves, one of the best-known surgeons in the East Midlands and senior surgeon to Lincoln County Hospital He was returning from hunting with the Burton Hounds when he was seen to fall from his horse, and a medical colleague found that death had taken place, apparently from a heart attack

Robert Black Purves was born at Moughyr, Bengal, on November 13, 1873, the elder son of H B Purves, Lieut.-Colonel, I M S He went to Epsom College in 1888 and in 1891 began the study of medicine at Edinburgh University, graduating M B, C M in 1895 He was then in turn house-surgeon and house physician at the Royal Infirmary, and after postgraduate study in Breslau became tutor in clinical surgery in the University of Edinburgh and assistant surgeon to the Deaconess Hospital He was admitted a Fellow of the Royal College of Surgeons of Edinburgh in 1899 Settling at Lincoln, he soon built up a reputation as a skilful surgeon, and was elected to the staff of the hospital In the war he served for some months at home and then went abroad to Egypt and Palestine with the Lincolnshire Yeomanry, and was on board the transport *Mercian* when it was shelled by an enemy submarine He was awarded the D S O in September, 1918, for conspicuous bravery in attending wounded under fire on that occasion He was granted the rank of lieutenant-colonel, R A M C (T A), and received the Territorial Decoration in 1922

Mr Purves was a Fellow of the Association of Surgeons of Great Britain and an active member of the Nottingham Medico-Chirurgical Society He joined the British Medical Association in 1898, was chairman of the Lincoln Division in 1922–3, and vice president of the Section of Orthopaedics at the Annual Meeting at Nottingham in 1926 In the following year he was sheriff of Lincoln, and only last week took the chair at the annual dinner of the Lincoln St Andrews Society, of which he was president Apart from his long and valuable work for the Lincoln County Hospital, of whose Extensions Committee he had served as chairman, he was consulting surgeon to the Lindsey County Council orthopaedic clinics to the Lincoln Maternity Hospital, the Skegness and Horncastle cottage hospitals, and the Bracebridge Mental Hospital

Dr JOSEPH HOLMES who had practised in Leeds for many years, died suddenly in retirement at Scarborough on November 27, aged 83 A member of an old Leeds family, he spent his boyhood at Hunslet and from Leeds Grammar School went to study medicine in Edinburgh, qualifying L.R C P and L.R C S.Ed in 1882 On returning to Leeds he started general practice in Meanwood, and was one of the first medical inspectors to be appointed by the Leeds Education Committee He practised single-handed all his working life and did his own dispensing, and in the course of half a century attended 6,500 confinements

Dr MARSHAM Á BECKETT MCCARTHY, who died on November 27 at St Bartholomew's Hospital, was the third son of the late William Frederick McCarthy of Deep Dene, Sydney, N S W, and a brother of Dame Maud McCarthy, G B.E, matron-in-chief of Queen Alexandra's Imperial Military Nursing Service, British Armies in France, during the war, and afterwards matron in-chief of the Territorial Army Nursing Service Dr McCarthy was a medical student at Edinburgh, taking the Scottish triple qualification in 1893 After serving as resident

herbalists He thought also that maternal mortality statistics ought not to be published, at least in any sensational way Notification would be a good thing but it could hardly come about until the public was better educated

Dr JAMES FENTON from the chair, said that if he had not been acting in an impartial capacity he would have liked to have argued on notification from a different point of view and he hoped that a further discussion might be arranged on that subject, when he would take care not to preside

EPIDEMICS OF VOMITING AND DIARRHOEA IN SCHOOL CHILDREN

At the meeting of the Medical Officers of Schools Association on December 3 Dr REGINALD MILLER read a paper on epidemics of vomiting and diarrhoea in children of school age It was stated in the subsequent discussion that there was a large epidemic of Sonne dysentery at present in the metropolis, especially in the Paddington area

Dr Miller devoted most of his paper to epidemic nausea and the dysenteries He said that the first epidemic to be described under the title of epidemic nausea occurred in Denmark in July 1935 and the first epidemic reported in England occurred in a girls boarding school in Broadstairs in March 1936 [1] Other epidemics were later reported including the large one in the Carshalton district in July 1936 The characteristics of the disease considered as an epidemic were that a peculiarly high proportion of the population (33 to 75 per cent) was attacked, that the clinical course of each case was limited to about forty-eight hours and the epidemic tended to exhaust itself in about two weeks and that the age and seasonal incidence were of no significance The causation was quite obscure The appearance of vertigo as a symptom raised the question whether the infection was of the nervous rather than of the alimentary system If it was to be regarded as a gastric infection it was difficult to see why the symptoms should last for so few hours and the epidemic itself be so comparatively brief when nothing had been done to cut short the disease And why should the vast majority of cases be afebrile? On the other hand, if it was to be regarded as due to some non-bacterial irritant taken into the stomach the absence of fever could be understood, though the other difficulties remained Again, if it was to be regarded as some infection of the nervous system which would account for the vertigo, there was the difficulty that although giddiness was a definite and prominent symptom, it was by no means constantly present It would seem best to regard it as a novel, if not a new epidemic, possibly air-borne, and probably infectious from case to case

Turning to Sonne dysentery he said that although it was so familiar a disease there were still several points about it that were worth discussion When an epidemic was seen to flare up in a children s ward must it be said that the spread of the disease was only through the faecal contamination of food? Could no one bring evidence conscientiously to be accepted of some other method of case to-case infection? Was a chronic carrier of Sonne dysentery unknown? The stools usually became free of the bacilli in about three weeks and might clear much more rapidly He noticed that an epidemic in a ward of children was almost always started by the admission of a convalescent case which was missed because the diarrhoea was no longer typical of the disease He did not think that the length of the attack was modified whether it was treated by magnesium sulphate or by such sedatives as bismuth, kaolin, and opium but he did feel rather strongly that the sedative treatment tended to lessen the discomfort for the child whereas the magnesium sulphate treatment increased it The lines upon which the spread of the disease must be prevented were quite obvious, and it was only necessary to emphasize how strictly prophylactic measures must be enforced In a children s hospital the routine examination of abnormal stools should be designed to include an examination for dysentery infection

[1] *British Medical Journal* 1936 1, 1242

THE PULMONARY ARTERY

At a meeting of the Liverpool Medical Institution on November 25 with Mr R KENNON in the chair Dr E L RUBIN read a paper on the visualization of the pulmonary artery by x rays

Dr Rubin said that though x rays were being increasingly employed as an aid in the diagnosis of heart disease the study of the pulmonary artery was often neglected The middle arc on the left border of the heart was formed by the main stem of the pulmonary artery the hilar shadows being largely created by the right and left pulmonary arteries When the patient rotated to his left the pulmonary artery could be followed on the screen and seen as the upper curve on the anterior border of the heart In a right oblique view the dividing pulmonary artery was seen as a dark rounded shadow beneath the arch of the aorta and in relation to the translucency of the left main bronchus The impression made by the left bronchus and the right pulmonary artery on the barium filled oesophagus was of diagnostic importance in spite of the controversy to which it had given rise This impression might however be caused by the pressure of other structures in the neighbourhood particularly by enlarged mediastinal glands The left pulmonary artery lent itself well to direct visualization in the left oblique view as it curved backward towards the shadow of the spine beneath the arch of the aorta It was seen in this view arching over the left bronchus and crossing the aortic window

The pulmonary artery might be enlarged in many conditions—for example, mitral stenosis congenital heart disease, emphysema goitre and sclerosis of the pulmonary vessels Enlargement of the main stem of the pulmonary artery showed itself as an undue prominence of the middle arc on the left border of the heart—a prominence which might take the form of an increase in length or in convexity or both Distension of the branches of the pulmonary artery was reflected in the increase in size and density of the hilar shadows, which might be pulsatile and enlargement of these vessels might be well shown in oblique views of the heart Congestive changes in the lungs appeared radiographically as a general loss of translucency throughout the lung fields together with a spottiness which cleared as compensation became re estab lished The study of the x-ray appearances of the pulmonary artery was of importance in that it provided information about the lesser circulation, which might be unobtainable during life by other means Without the help of radiology the physician s information about the pulmonary artery was largely presumptive

General Discussion

In the discussion which followed, Dr H WALLACE JONES emphasized the increasing importance of x rays in the diagnosis of cardiac disease He mentioned that mitral stenosis was the commonest condition in which enlargement of the pulmonary artery occurred and that this was usually the first indication of a change in the size of the heart and could be detected long before the enlargement of the left auricle or before there were any clinical signs of cardiac enlargement He also discussed the enlargement of the pulmonary artery which took place in thyrotoxicosis, and noted the absence of any adequate explanation as to how this change was brought about Dr ROBERT KEMP said that Dr Rubin s work on the radiological appearances of the heart was of great value to the clinician, and at the same time a serious challenge to the traditional clinical methods The large pulmonary

surgeon and resident physician at the Royal Infirmary, Edinburgh he practised for some years in New Zealand, and was honorary surgeon to the Wairarapa District Hospital He took the F.R.C.S.Ed. in 1917, and during the war was surgeon to Queen Alexandra's Military Hospital with the rank of Captain R.A.M.C.

Dr ROBERT CAREY FISHER who practised at Skipton Yorks for over forty years, died on November 27 aged 66 He was born at Mountrath Queen's County and studied medicine in Dublin at the School of the Royal College of Surgeons qualifying L.R.C.P. and S.I. in 1893, and taking the L.M. of the Rotunda Hospital He had been a member of the honorary medical staff of the Skipton and District Hospital since its erection nearly forty years ago and was chairman of the Skipton Medical Committee He joined the British Medical Association in 1911 as a member of the Bradford Division Dr Fisher had been an excellent shot and in later years kept up his skill as an angler and amateur photographer

The following well known foreign medical men have recently died Professor LUDWIG MANDL an eminent gynaecologist of Vienna Dr LEON KRYNSKI formerly dean of the medical faculty of Warsaw and a member of the International Society of Surgery, and Dr JOSEPH LEGGETT MILLER president of the Chicago Institute of Medicine and for many years editor-in-chief of the *Archives of Internal Medicine* aged 70

Medical Notes in Parliament

The National Health Insurance (Juvenile Contributors and Young Persons) Bill passed through Committee in the House of Lords on December 7

The Unemployment Insurance Bill was read a second time by 198 to 118 in the House of Commons on December 2 In explaining the Bill Mr Ernest Brown referred to the proposals for authorizing provision of meals at junior instruction centres and for medical inspection and treatment at such centres in Scotland

On the same day Sir Edward Mellanby discussed medical subjects with the Parliamentary Medical Committee He spoke on nutrition and diet as affecting the need for dental care, especially of children in their earliest years He also dealt with cancer research and leprosy research, and with the reform of medical education

The Air Raid Precautions Bill passed through Committee and third reading in the House of Commons on December 7 Progress was also made during the week in the Commons with the Coal Bill and the Blind Persons Bill

In the House of Lords on December 7 the Divorce and Nullity of Marriage (Scotland) Bill was read a second time Lord Alness who moved the second reading said that he had omitted from the Bill provisions as grounds of divorce of habitual drunkenness and repeated conviction for serious crimes or a sentence of penal servitude

Nutritive Value of Pasteurized Milk

Sir KINGSLEY WOOD told Major Neven Spence on December 2 that his medical advisers were satisfied from experiments carried out at the National Institute for Research in Dairying and the Rowett Research Institute that pasteurization had no significant effect on the nutritive value of milk It was however especially desirable in the case of children reared on a milk diet, whether the milk was raw or pasteurized that the diet should be supplemented by some fruit or vegetable juice such as orange or tomato This view was supported by the Committee on Cattle Diseases under the chairmanship of Sir Frederick Gowland Hopkins which reported in 1934

Working Hours of Nurses

Mr F. O. ROBERTS in the House of Commons on December 3 moved the second reading of the Local Authorities (Hours of Employment in connexion with Hospitals and Institutions) Bill He recalled that the Nurses Registration Act of 1919 did not provide as to working conditions for nurses The measure he moved dealt only with hospitals and institutions controlled by local authorities It provided a forty-eight hour working week for outdoor staffs except in cases of emergency where extended work would be permitted if overtime rates were paid for hours worked in excess of forty eight So far as indoor staffs were concerned the Bill proposed to create a ninety-six hour fortnight, again making provision that in emergency extra hours might be worked beyond the ninety six provided overtime was paid Another provision sought to establish one weekly day of rest for all workers

Mr MARSHALL seconded the motion

Mr ERSKINE HILL moved an amendment declining to give the Bill a second reading "in view of the setting up of an Interdepartmental Committee on the Conditions affecting the Nursing Services" He said the problem of these services was not only one of hours but one of conditions of service and should be dealt with in a comprehensive measure Major NEVEN SPENCE seconded the motion for rejection

Sir FRANCIS FREMANTLE said he spoke as the only member present of the Interdepartmental Committee which had held its first meeting the previous day That committee so far had only considered procedure but he could say there would be a large measure of agreement among its members with the main principles of the Bill The objects of the Bill would also be generally approved by those with whom he had worked in the medical and nursing services particularly in regard to the ninety six hour fortnight. They could not take the principles of factory organization into hospital life in trying to establish an eight hour day because that meant a fifty six hour week or 112 hour fortnight If the Bill was passed municipal authorities would promptly increase their staffs and take nurses away from the voluntary hospitals throughout the country including cottage hospitals The change had to be done gradually and with the voluntary hospitals in mind Even the London County Council could only manage a forty-eight hour week for their mental hospitals and for their other hospitals a fifty four hour week The L.C.C. could do that because it had the rates behind it

After further discussion Mr BERNAYS said every member of the House sympathized with the object of the Bill The working conditions of many nurses were not satisfactory and called for searching examination The associations of local authorities had not been consulted on the Bill nor had they considered its provision The London County Council had not been asked for its views The shortage of nurses had recently grown more acute and a committee had been set up to review the probable developments and requirements of the nursing service in the future The committee was charged to inquire into other fundamental questions besides hours of labour which militated against the adequate recruitment of nurses. The House would stultify itself and embarrass the committee if it proceeded with the present Bill He asked the House to reject it and dealing with complaints about the constitution of the committee said associations of nurses would have the fullest opportunity of giving evidence and the committee did in fact include a working nurse

The Bill was rejected by 122 to 111

Oysters and Typhoid

On December 6 Mr RAMSBOTHAM informed Mr Craven Ellis that a recent reduction in the demand for oysters had been attributed to nervousness on the part of the consuming public induced by the outbreak of typhoid There was no evidence to suggest that this outbreak was connected with the consumption of oysters or other shell fish The Ministry of Agriculture directed attention as opportunity offered by means of reports leaflets lectures by officers of the Department and otherwise to the existence of supplies of purified oysters and

artery seen in thyrotoxicosis was probably linked clinically with the harsh pulmonary systolic bruit sometimes heard in that condition

At the same meeting Mr W J EASTWOOD read a paper on orthopaedics—old and new Dealing chiefly with fractures, Mr Eastwood traced the history of their treatment from the Egyptian era to the present day An interesting discussion followed, in which Mr T P MCMURRAY, Mr E N WARDLE and Mr NORMAN ROBERTS took part.

Local News

ENGLAND AND WALES

London (Royal Free Hospital) School of Medicine for Women

The annual dinner of the London (Royal Free Hospital) School of Medicine for Women was held on December 2 at the Savoy Hotel, when Mrs Kinnell presided over a company numbering about 300 In proposing the toast of 'The School and Hospital" the chairman said that she had been "primed" by the secretary with a good deal of relevant and interesting matter concerning the history of the school, but she thought that enough on the historical side had been given in the dean's address at the recent inauguration of the new session One matter to which she wished specially to refer was the retirement of Miss L M Brooks, the warden and secretary, after years of devoted service which had formed so intimate a part of the life and working of the school It was pleasant to think that her retirement found her in the best of health and spirits and able to realize her dream of a trip round the world She had sent from Honolulu her greetings to that gathering The school was to be congratulated on the election of Miss Nancy Moller to Miss Brooks's post The chairman went on to say with what great satisfaction the school had received the continued assistance of the Clothworkers Company, which had added an extra scholarship and a prize Both the school and the hospital were institutions which filled a large part of the lives of most of those present The liaison was working very satisfactorily at Brunswick Square But she stressed the fact that neither hospital nor school could stand still Research and experiment must go forward The hospital was under a solemn obligation with regard to the school, and the standard of students facilities had to be maintained So long as the voluntary system existed the public could not escape appeals for these needs It was often forgotten by the public that hospitals had the responsibility of teaching The standard of a teaching hospital had also to be kept high in order to serve as a measure of excellence for other hospitals Mr P Jenner Verrall, who proposed "The Guests," said that when he left 'the greatest hospital in the world" (St Bartholomew's) he was warned by its journal of the dangers he would encounter at the Royal Free in particular the danger of meeting intellectual women But he had known intellectual women both of the present and past generations, and in his experience they remained women, with their genius for sympathy, hospitality, and the giving of social comfort He welcomed some intellectual women among the guests that evening, notably Miss Grace Hadow, Principal of the Society of Oxford Home Students, Miss Elizabeth Robins, an outstanding figure in drama and literature, and Miss F H Melville, late Mistress of Queen Margaret College, Glasgow He also welcomed Mr David Low, the celebrated cartoonist, Sir Walter Schroeder and Dr W B Purchase former and present coroners, Sir George Chrystal Secretary of the Ministry of Health, and Dr N G Horner and Dr E C Morland, Editors of the *British Medical Journal* and the *Lancet* respectively Mr David Low, in response, humorously remarked that being "cursed" with good health his experience of doctors was very small, but he "had not read his Cronin for nothing" He had been accustomed to regard doctors with some suspicion, and it had always seemed to him that doctors should not be rewarded when they came but only when they went away They might be regarded as members of a sinister profession which thrived on the afflictions of humanity, though he acknowledged that the same might be said of cartoonists No one, however, knew better than he that, despite these considerations, they gave unselfish service to humanity At any rate until both medicine and art were nationalized he proposed to be very scrupulously respectful to doctors and cartoonists both Miss Grace Hadow also responded in a brief speech, and after the toast of "The Chairman," proposed by Dr D C Staveley, the formal proceedings gave place to dancing

Tuberculosis in Birmingham

Birmingham, with a population of just over a million inhabitants, has one centrally situated tuberculosis dispensary which serves the whole city, and four sanatoria totalling 613 beds The medical staff of the dispensary, with one exception, are also responsible for the medical work of the municipal sanatoria In two of the sanatoria beds are specially provided for advanced cases, and in 1936 (according to the report of Dr G B Dixon, the chief clinical tuberculosis officer) 45 5 per cent of the 805 deaths in the city from all forms of tuberculosis occurred in the municipal sanatoria and hospitals controlled by the Public Health Committee At present there are in the city five persons suffering from tuberculosis per 1,000 of the population The decline in the incidence of the disease is shown in the following figures all forms, five-year period 1922–6, the death rate per 1,000 was 1 1, and for the five-year period 1932–6 it was 0 85, a reduction of 22 7 per cent new cases, three-year period 1924–6, the incidence per 1,000 was 1.96, and in the three year period 1934–6 it was 1 21, a reduction of 38 per cent The corresponding figures for 1936 alone were 0 78 and 1 1, both the lowest on record Of 1,136 new cases of tuberculosis notified during the year, fifty-six, of which thirty-five were pulmonary cases, were not notified until after death Of these, forty patients died in hospital, and thirty-one of the cases were diagnosed as the result of a necropsy twenty eight of the patients were over 50 years old at death In a number of the cases tuberculosis was associated with other grave diseases, and may not have been the primary cause of death Dr Dixon points out that "had so many of these persons not died in hospitals the number of autopsies would have been definitely fewer and the tuberculosis would probably have escaped detection in quite a large proportion' Of the patients first examined at the dispensary no treatment was required for 223 out of 854 newly notified, 276 out of 1,903 "suspects" were advised institutional treatment, which was also found necessary for thirty-nine out of 1,215 contacts Dr Dixon's report is particularly interesting for the results of the contact examinations, which are apparently carried out with great thoroughness, including gastric lavage in children Among the contacts examined during the years 1931 to 1936 the percentage found to be suffering from tuberculosis was as follows

Age	0-5	6-10	11 15	16 years
Contacts to patients with positive sputum	6 8	5 4	4 3	7.5
Contacts to patients with negative sputum	3 8	3 4	3.2	5 1

Liverpool Psychiatric Clinic

The Liverpool Psychiatric Clinic has issued a report covering the period from its inception in 1924 to 1937 When this clinic was opened there were no facilities in the north-west of England for out-patient care of mental and nervous disorders in patients unable to afford private

mussels, and explained the methods of purification and the resulting advantages An immediate requirement that all molluscs intended for human consumption should be cleansed would not at present be practicable, but the subject was receiving the consideration of the Ministry of Agriculture and the Ministry of Health

Unfit Recruits Successful Experiment—On November 30 Mr HORE BELISHA replying to Mr Bellenger, said that the maximum number under training at any one time at the Recruits Physical Development Depot was 235 The transfer of the Depot to Canterbury on November 20, would enable 300 to be taken as soon as the accommodation was complete The results of the experiment were most encouraging. Of 305 men who completed their training at the Depot 295 had been passed fit and sent to the regimental depots He hoped to be able to extend the experiment, which was one of the finest services that the Army had rendered to the community It had taken boys not completely fit and had brought them up to standard by the most careful physical training

Research into Epilepsy—In a reply to Sir Arnold Wilson on November 30 Sir KINGSLEY WOOD said he had no special information as to research into epilepsy, but knew that research into the treatment was proceeding continuously in the institutions which dealt specially with this disease He added that the crude death rate from epilepsy was 52 both in 1926 and in 1936 The standardized rates were for males 56 in 1926 and 52 in 1936 females, 42 in 1926 and 39 in 1936

Sleeping Sickness in Nigeria—In reply to Mr Sorensen on December 1 Mr ORMSBY GORE said that figures for the last ten years showed there had been a considerable increase in the incidence of sleeping sickness in Nigeria The Nigerian Government had spent over £25 000 annually to combat the disease, and had recently decided to devote an extra £30 000 a year for five years towards the concentration of population in fly-free areas Sleeping sickness was borne by the tsetse fly, which infested rural areas, and was consequently unaffected by urban sanitation

Automatic Respirators—Mr ROSTRON DUCKWORTH asked the Minister of Health on December 2 how many automatic breathing apparatuses known as 'iron lungs' were in this country whether he was aware of any shortage, and whether he would stimulate their provision either directly or indirectly Sir KINGSLEY WOOD said he had no means of knowing how many of these articles of surgical equipment there were in this country Occasions on which their use was required were rare They could be obtained by purchase or on loan and he had no information that there was any shortage

Retired Medical Officers and Official Inquiries—Sir KINGSLEY WOOD told Sir Francis Fremantle on December 2 that he had received a resolution by the Barrow in Furness town council deploring the action of retired medical officers of health in appearing against local authorities at inquiries held by the Ministry This resolution related to inquiries held by his inspectors into Orders made under the Housing Act, 1936 Sir Kingsley added that it was for owners of property affected by such Orders themselves to decide what evidence they should produce at an inquiry He had no intention of doing anything to diminish their rights in this respect.

Tuberculosis Order Meat for Human Consumption—Mr W S MORRISON stated, on December 3 that it was not the usual practice of local authorities to enter into formal contracts for the sale of meat of animals slaughtered under the Tuberculosis Order of 1925 Two local authorities in Scotland had made such contracts The Tuberculosis Order of 1925 (No 2) provided that where a local authority proposed to slaughter an animal under the Order and to dispose of its carcass or any part thereof, for human consumption notice of the time and place of intended slaughter should be given to the public health local authority, and further provided that the carcass of the animal or any part thereof should not be removed from the slaughterhouse for human consumption except with permission, in writing of the medical officer of health or other competent officer of the authority having power to inspect and examine meat intended for human consumption

Foot and-Mouth Disease—On December 6 Mr RAMSBOTHAM informed Mr Short that the theory that the present series of outbreaks of foot-and mouth disease in the eastern and southern counties of England was to be attributed mainly to infection carried by mass migration of birds was based on circumstantial evidence only The Foot-and Mouth Disease Research Committee proposed to carry out experiments to ascertain whether birds were susceptible to foot and mouth disease, or were capable of transmitting the virus mechanically

Notes in Brief

Mr Duff Cooper is advised that inoculation of troops for typhoid twelve months before embarkation for India would not confer additional protection The majority of cases of typhoid occurred during the first twelve months of service in India among persons who did not obtain immunity by inoculation

Conferences between inspectors of the Ministry of Health and members and officers of the local authorities in Carmarthen concerning housing conditions in that county, as exposed in the report of the county medical officer, were due to begin on December 7

Extension of the requirement as to periodic medical examination to workers employed in additional processes involving risk of silicosis in the pottery industry is under consideration with a view to amendment of the Silicosis and Asbestosis (Medical Arrangements) Scheme, 1931

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH

At the annual meeting of the College, held on December 2 Dr Alexander Goodall was elected President for the ensuing year Drs W T Ritchie, O B E. Edwin Bramwell John D Comrie Charles McNeil A Fergus Hewat, and D M Lyon were elected members of council The President nominated Dr Comrie as Vice President

Dr G Lovell Gulland C M G and Dr R B Campbell were appointed representatives of the College on the board of managers of the Royal Infirmary, Edinburgh

The Services

DEATHS IN THE SERVICES

Lieut -Colonel ROBERT RICHARD HARVEY WHITWELL, Bengal Medical Service (ret) died at Worthing on December 1, aged 82 He was born at Kamptht, Central Provinces India on October 6, 1855 the son of Henry Whitwell conductor Ordnance Department and was educated at Edinburgh University where he graduated M B C M in 1879 and B.Sc in Public Health in 1880 He entered the I M S as surgeon on March 31 1880 became lieutenant colonel after twenty years service and retired on September 17 1905 During the war of 1914–18 he rejoined and served as district medical officer in Cyprus in 1916–17 Most of his service was passed in civil employment in Bengal, where he had charge of the important civil surgeoncies of Patna and Howrah in his later years His elder brother Surgeon-Major Henry Whitwell entered the I M S on April 12, 1868, and died at Bankipur on July 6, 1887

treatment The original premises consisted only of two rooms, but expansion has been rapid and, following two intermediate moves this venture of faith is again forced to seek more commodious accommodation During the period under review nearly 20 000 patients have attended the clinic, the attendances within the last two years having increased by 41 per cent An analysis of eighty children and adolescents referred to the clinic in the course of a year shows that behaviour disorder and nervous disorder account for rather more than half of the total cases Of twenty four patients referred for mental defect twenty were girls The comparatively large proportion of mentally defective girls is attributed to the fact that many social organizations use the clinic as a diagnostic centre for cases of social failure of various kinds This cannot therefore be regarded as a group which is representative of the normal community The report states that the clinic has laboured continually under financial difficulties, the present regular income being less than a third of the working expenses It is hoped that the efforts of the small band of supporters who have partially overcome the deficit will be seconded by annual grants from public authorities and local societies and by an increased number of subscribers

Tuberculosis Inquiry in Wales and Monmouth

The Ministry of Health announces that the Committee of Inquiry into the Anti Tuberculosis Service in Wales and Monmouth has held its first full meeting and is now awaiting the submission of memoranda of evidence So far memoranda have been received only from the Welsh National Memorial Association The committee contemplates holding at an early date its next meeting at which the witnesses of the Welsh National Memorial Association will be heard It is however necessary that memoranda of evidence should first be received from the local authorities sufficient to indicate the points which the authorities will desire to raise and the committee hopes that these memoranda will be submitted in time to enable the next meeting to be held at Cardiff early in the New Year

SCOTLAND

Orthopaedic Centre in Dundee

Opening an Orthopaedic and Rheumatic Clinic in Dundee on November 25, Mr W A Cochrane surgeon to the Princess Margaret Rose Hospital for Crippled Children, Edinburgh said that the clinic was an example of public spirited action and evidence of the vigour value, and importance of voluntary effort as distinct from State action There were over 800 voluntary hospitals in Britain, and it was a profound error to imagine that their day was past. A clinic such as this one in Dundee had many sides to its work In the similar clinic at Edinburgh, which was the consultative centre for much of the work for the care and cure of crippled children at the Princess Margaret Rose Hospital all kinds of crippling errors in childhood, such as club foot knock knee flat-foot, infantile paralysis, and curvature of the spine were referred to it from the schools and child welfare centres In this way the potentially and actually crippled were sought out and received proper care at an early stage The crippled child was made and not born and he became a cripple because he was allowed to become one The majority of crippling errors in childhood could be cured and the secret of this was early diagnosis and early out patient care through the activity of a clinic which was at hand The clinic also should supervise after-care throughout the growing period to prevent relapse

Edinburgh Samaritan Society

At the annual meeting on November 23 of the Edinburgh Samaritan Society Sir David Wilkie urging the need for continued support by subscriptions and by contributions of clothing, said that the work of this society was held in high regard by the whole medical profession and in particular by the honorary staff of the Royal Infirmary Continuing he said that of recent years the need for rehabilitation of the injured and the importance of the psychic factor in promoting quick and full recovery from illness had been emphasized Sometimes the most important part of treatment was that which took place during the few weeks or months after the patient left the hospital The necessary mental rest might be impossible because of economic worries dietetic treatment which was easily prescribed might be difficult to obtain on a slender weekly income or the apparatus needed to support a damaged limb might cost more than the patient who was off work could possibly provide These and similar problems were the society's constant care An organization to meet such needs must be conducted with insight, sympathy, and understanding Personal attention to individual cases without extravagance but with a broad humanity and tact must be a labour of love Not a week passed but in some contingency or other affecting patients he felt a debt of gratitude to this society It was stated at the meeting that during the past year the new cases with which the society had dealt numbered 362, and its almoners had paid 1 071 visits Payments in money had amounted to £758 and 3 161 articles of clothing had been distributed There would be still greater claims upon the society in future when the extension of the Royal Infirmary was carried out

Sale of Methylated Spirits

The Methylated Spirits (Sale by Retail) (Scotland) Act 1937 which provides for the control of the sale by retail of mineralized methylated spirits and surgical spirit in Scotland will come into operation on January 1 1938 The Act provides *inter alia* that no person other than an authorized seller of poisons (that is in general a person keeping a pharmacy or chemist's shop) shall retail to the public any mineralized methylated spirits or surgical spirit unless his name has been entered in a list to be kept for the purposes of the Act by the local authority The Act makes it unlawful knowingly to sell these substances to any person under 14 years of age It also requires that the bottle or other vessel containing them sold by retail shall bear a label specifying the name and address of the seller and the name of the spirit, and that the seller shall keep a record of prescribed particulars of the sale This record must be contained in a book kept for the purpose, and the entry recording the sale must be signed by the purchaser unless the seller has received a signed order The above provisions do not apply to (*a*) the sale of surgical spirit by an authorized seller of poisons, and (*b*) the supply of surgical spirit by a duly qualified medical practitioner, a registered dentist or a registered veterinary surgeon for professional purposes if the requirements of Section 19 (2) and (3) of the Pharmacy and Poisons Act, 1933 are complied with in relation to such sale or supply of surgical spirit in like manner as if it were a medicine Any inquiry as to any provision of the Act should be addressed to the local authority of the district Copies of the form of application may be purchased (price 1d) from H M Stationery Office 120 George Street, Edinburgh, 2

INDIA

A Fund to Combat Tuberculosis

A fund to fight tuberculosis in India to be called the King Emperor's Fund, was launched last week by the Marchioness of Linlithgow wife of the Viceroy The Premiers of the Provinces, responding to personal letters of appeal from the Vicereine, have offered full support to the campaign The King Emperor and the Queen and the Viceroy and Vicereine made donations to inaugurate the fund, and contributions have already been received

Medical News

Among the subjects dealt with in the *Supplement* this week is the British Medical Association's inquiry at the request of the Committee of Imperial Defence into the intentions of doctors in regard to various forms of emergency medical services

The House of the British Medical Association including the Library will be closed for the Christmas holiday from 4 p m on Friday, December 24, to 9 a m on Tuesday, December 28 (Library 10 a.m.)

In our advertisement columns this week the Senate of the University of London invites applications for the University Chair of Medicine tenable at St Bartholomew's Hospital Medical College at a salary of £2 000 per annum

A combined meeting of the Association of Industrial Medical Officers with the Society of Medical Officers of Health will be held at the London School of Hygiene and Tropical Medicine, Keppel Street, W C, on Friday December 17, at 5 30 p m, when a discussion on 'The Public Health Services and Industrial Hygiene' will be opened by Dr J J Buchan and Dr Donald Stewart

The British Institute of Philosophy announces that an address entitled 'The Limits of Science' will be given by Professor John Macmurray on Tuesday December 14 at 8 15 at University College Gower Street, W C Cards of admission may be obtained from the Director of Studies at University Hall, 14 Gordon Square W C 1

Owing to illness Mr J C Trevor was unable to read the paper on 'Some Anthropological Considerations of Race Crossing' before the Eugenics Society on November 23 and this has been rearranged for Tuesday, December 21 at 5 15 p m, at the rooms of the Royal Society, Burlington House Piccadilly, W

At the meeting of the Pharmaceutical Society of Great Britain at 17 Bloomsbury Square W C on Tuesday December 14, a lecture on 'Biochemistry and Pharmacy' illustrated by lantern slides will be given by Mr F Wokes, B.Sc The president will take the chair at 8 30 p m

At a meeting of the Académie de Médecine on November 6 Dr Antoine Béclère whose death was wrongly reported some months ago, delivered a remarkably brilliant address on Descartes and medicine

The annual dinner of the Medico Legal Society will be held at the Trocadero Restaurant (Empire Suite) Piccadilly Circus W, on Friday December 17 at 7 for 7 15 p m

Dr R Cecil Robertson, the head of the pathological division of the Henry Lester Institute in Shanghai is leaving shortly for China as the head of No 3 Unit of the League of Nations Epidemiological Mission to China Dr Robertson is at present in London at the League of Nations Office 16 Northumberland Avenue W C 2 selecting the medical staff to accompany him

The Queen on November 25 opened the new maternity and child welfare centre and day nursery in Bessborough Street Westminster which has been established by the Westminster City Council at a cost of £51 000

The November issue of *Industrial Welfare and Personnel Management* the journal of the Industrial Welfare Society, includes an article on Nuffield College by the secretary of the Politics Research Group Oxford and a review of a recent exposition of the Factories Act 1937 by Dr Howard E Collier head of the Department of Industrial Hygiene and Medicine University of Birmingham

Dr Matthew B Ray D S O who has been a member of the council of the Save the Children Fund since its inception has accepted an invitation from the council to become a vice president and honorary medical adviser

Up to the time of going to press the number of known or suspected cases of typhoid fever at Croydon was 269 with 17 deaths

In accordance with a resolution of the international committee and with the decision of the organizing committee elected by the Genetical Society of Great Britain at the seventh International Congress of Genetics will meet in Edinburgh in 1939 probably from August 23 to 30 inclusive Professor F A E Crew, Institute of Animal Genetics, University of Edinburgh Edinburgh 9, has been appointed general secretary to the congress and to him all correspondence concerning it should be addressed

The November issue of the Out patient Time-table has just been published by King Edward's Hospital Fund for London, and has been sent to all doctors in the London area and to a large number of welfare societies This time table is of great help in reducing the waiting period in out patient departments in that it enables medical practitioners to have at their disposal the correct day and time for the treatment which their patients need Further copies are obtainable free from the publishers, Messrs Geo Barber and Son Ltd 23, Furnival Street, E C 4

At the annual meeting of group representatives of the Hospital Saving Association held on December 1 at Kingsway Hall London it was announced that the income from contributors last year was £1,004 000 Sir Alan Anderson read from the chair a message of congratulation and encouragement from the King The chairman said that progress had been well maintained during the past year with an increase of 123 000 in the number of contributors and of £83 000 in contributory income At the end of July the contributors numbered 1 778,236 Sir Walter Kinnear said that in fifteen years the H.S.A had disbursed £5 000 000 for hospital services

The London Hospitals Street Collections Central Committee by combining flag days in the City and the Metropolitan Police District, has collected more money for the hospitals of London in three combined collections during 1937 than was brought in by the fifty six collections organized individually in 1936 by the hospitals concerned The collections this year have yielded over £32,500

The King has appointed Dr A D J E Williams, O B E Director of Medical Services, to be an Official Member of the Legislative Council of the Nyasaland Protectorate

The thousandth case and the fifty seventh death in the infantile paralysis outbreak in Victoria were reported from Australia last week The epidemic started on June 21 Up to the end of November only 173 cases had occurred outside Melbourne

A chair of the history of medicine has recently been created at Buenos Aires with Professor Juan Ramon Beltrar as its first occupant

Dr Schüffner professor of tropical bacteriology at Amsterdam University, has recently retired A museum named after him has been founded in his honour

A monument to the memory of the late Professor Emile Roux director of the Pasteur Institute of Paris was unveiled at his birthplace Confolens on November 14 when the present director Dr Louis Martin, delivered an address
